— THE luxury of modern traveling costs a great deal of money. A dining car of the most approved pattern costs $15,000 to build. Next come the kitchen utensils, the table furniture, the silverware and linen—averaging about $3000 to a car. Each car must have a steward, who usually gets $100 a month, a head cook, who values himself at $75 a month. There must also be one or two assistant cooks and three or four waiters. Three hundred dollars a month is the very smallest outlay for wages, while the cost of raw food material, breakage of dishes and the board of employees is about $3000 per month additional. An average five days' run costs nearly $600 for food and service, so that it would take forty persons at every meal on the run to pay the daily expenses, without allowing anything for interest on the investment, or for wear and tear on the furnishings.—*The Evening Sun.*

— SAFEGUARD FOR THE FUTURE.—A girl should be given an allowance every week, if it is not more than fifty cents. It will teach her how to handle the great sums intrusted to her care when she marries. —*Atchison (Kan.) Champion.*

— A MEAN TRICK.—Patrick was one of those witty sons of the Celtic Isle whose amusing sayings had entertained many transatlantic travelers.

One day, when the steamer was about leaving port, Patrick received the order to haul in a long cable that dragged astern. Patrick jumped to the task cheerfully enough, and hauled away contentedly. But the excessive length of the cable taxed his patience.

"I wonder what's become of the end of this ould cable, anyhow?" And finally, growing impatient, he growled out: "Fath, it's no use hauling away at the baste uv a cable Some divil's cut the end off uv it."—*Harper's Magazine.*

— HARRY: "I understand she gave you a flat refusal?" Jack: "Yes; nothing under a four story brown stone would satisfy her."—*National Standard.*

SECOND EDITION.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING.

WITH THIRTY-FIVE ILLUSTRATIONS.

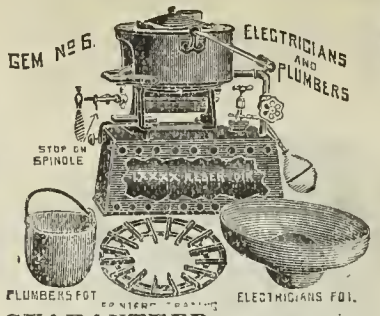
43 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.



The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published

Sent, post-paid, on receipt of price, 25c

Also Manufacturer of Copper Range Boilers, Closet Seats and Tanks and Brass Work.

POCOCK'S ECCENTRIC

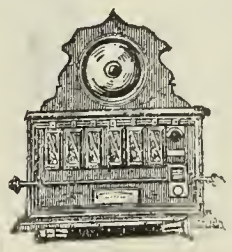
FORMING MACHINE.

We invite your attention to this new Former for Tinners' and Sheet-Metal Workers' Rolls, on which we claim rapidity of operation, superior construction and durability. The back roll is moved by eccentrics instead of screws, and can be changed instantly from the smallest circle to the passing of a straight sheet. It will flare metal easier and better than any other machine in use. You can get closer to front roll, therefore bend a smaller circle. For sale by all leading jobbers. Send for circular to

O. POCOCK, Mfr.
363, 365, 367 Clark St.
CINCINNATI, OHIO.

3-inch Rolls with Slip Rolls a specialty

At this time of the Year



metal workers are busy fixing furnaces, steam pipes, etc. Dixon's Graphite Pipe Joint Grease will make a better joint than red or white lead and parts can be separated easily even years after. When used on valves it does not harden or cause the valves to stick. Send for circular and sample.

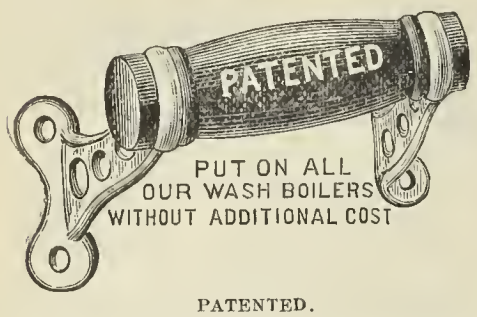
$1000



NASHUA, N. H., FEB. 28, 1895.

We have claimed in good faith that cream can be frozen in the "Improved" WHITE MOUNTAIN FREEZER in FOUR MINUTES. This, we maintain is *one-half* the time required to produce like results with any other Freezer on the market.

One of our esteemed competitors has "*Challenged the Claim*" that we have made, and now, as an evidence of our good faith, we hereby offer to deposit the sum of ONE THOUSAND DOLLARS with the publisher of THE IRON AGE, to be forfeited absolutely and by him contributed to any Charitable Institution in the United States in case we fail to prove before any disinterested committee of three persons, each and every statement we have made, either publicly or privately, relative to the matter under consideration, provided, however, that our competitor will deposit an equal sum, and subject to same terms and conditions as mentioned above.

The White Mountain Freezer Co.

ROYAL
WASH BOILER HANDLE.

PATENTED.

We call the trade's special attention to the Royal Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.

The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

Improvements are being made in all lines of manufacture. Why not in Ice Cream Freezers?

"TICKLED TO DEATH."

To the Trade:

We are making the "OHIO" Ice Cream Freezer, which is new and good, of full size and excellent finish. It is far superior to any other. It works to perfection and pleases everybody.

Nothing like it in the market. We have undertaken the manufacture of this Freezer on account of its great merit. If you deal in Freezers you would like to see it. **Send for a Sample.**

AN IMPORTANT FIXTURE.

A new Water Closet for Hospitals, School Houses and Public or Private Buildings.

THE

Puritan Wash-Down Water Closet.

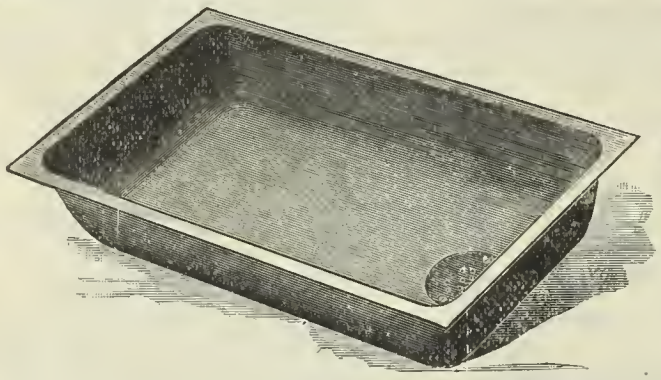
PATENTED.

WHY THE PURITAN WASH-DOWN IS BETTER THAN ANY OTHER FORM OF CLOSET.

It is simple and compact. The Tank being connected directly to the closet does away with unsightly pipes on the wall and reduces the noise to a minimum. and at the same time being more effective. and has a larger surface of water. The joint where the earthenware connects with the soil pipe is under water, which is an absolute safeguard against the leaking of sewer gas. It is especially adapted for fire proof buildings. and the soil pipe can run on the floor either in front or behind the partition. There is no chance for stoppages and there are no concealed spaces, all parts being accessible.

The body of the closet is made of vitreous or non-absorbing ware and is perfectly sanitary.

GOOD FIXTURES ARE CHEAP, AND POOR FIXTURES ARE EXPENSIVE.



Each Closet is guaranteed for a term of years. Call and see the operation of the Closet at our **SHOW ROOM.**

WESTERN AGENTS: ILLINOIS ROOFING & SUPPLY CO. CHICAGO, ILL.

Gummey's Anti Pin Hole Bright Tin Plate.

By permission of Messrs. Fieber & Holmes, Brookville, Indiana, we insert the following testimonial:

BROOKVILLE, IND., FEB. 1, 1895.

Messrs. GUMMEY, SPERING & Co.,
Philadelphia.

GENTLEMEN:

We have some Coffee Pots and Boilers made from your Anti Pin Hole Tin which have been in use over a year and only one of them ever came back for repairs. In this one case it had a flat copper bottom, and the *bottom* was worn out. We carefully examined the tin on the inside and could not see that it was eaten a particle.

This Boiler was a very large one for the County Poor Asylum.

Yours truly,

(Signed) FIEBER & HOLMES.

The officers of this Company are the surviving members of the old firm, and the management, manufacture and inspection of each plate are in charge of the same individuals as heretofore.

Also sole factors

Blairsville Rolling Mill and Tin Plate Co.,

Manufacturers

Black Plate, Tin Plate, Terne Plate.

Offices and Warehouses, 122 and 124 Second Ave.,

PITTSBURGH, PA.

BEWARE OF IMITATIONS.

"BREVITY" MAY BE "THE SOUL OF WIT"—

But short pieces of tin do not make "TANDEM" CONTINUOUS ROOFING....

CUSTOMERS are told what to expect—and get it. In "TANDEM" they get a roll of good, prime tin, made of sheets 96 in. long, furnished either 14 in., 20 in. or 28 in. wide; and, if desired, THOROUGHLY WELL PAINTED.....

"TANDEM" is put on the market under no false pretenses. It is not a light weight tin; it is not made from 14 x 20 in. or 20 x 28 in. sheets—and IS NOT SOLDERED BY HAND.....

"TANDEM" Continuous Roofing Tin is made in IC and IX thicknesses. Primes and Wasters are sold separately. Before buying continuous roofing tin, be sure of what is being offered you in competition with "TANDEM".....

The Unmarried Women of America.

It appears that in 1890 the number of women of all ages in the United States was 30,554,370, of whom 17,183,988, or 56.24 per cent, were single. The important fact for our present purpose is the number or percentage of marriageable women who are in fact not married. It is found that about 10 per cent. marry before the age of 20, and a very few before 15. The unmarried are made up of maids, widows and divorced persons, the last of which classes is so small that it need scarcely be considered for the present purpose. Omitting the actual numbers and using percentages only, the returns show that between the ages of 20 and 25 about 53 per cent. were without husbands; between 25 and 30, about 28 per cent.; between 30 and 45, about 20 per cent. After this the number of widows increases so rapidly that from 45 to 55 the unmarried amount to 26 per cent., and of women over 65 years of age only a little over 35 per cent. have husbands. Nearly 6 per cent. of all women never marry; about 10 per cent. of those between the ages of 35 and 45 had not yet married, and more than one-fourth of those between the ages of 25 and 30 were still unmarried.—*Brooklyn Eagle.*

— THE MINOR TORTURES OF LIFE.— Lord Aberdeen tells the following story on himself: He left London at midnight in a sleeping car for the North. In the morning when he was awakened he saw a stranger opposite him.

"Excuse me," said the stranger, "may I ask if you are rich?"

Somewhat surprised, his Lordship replied that he was tolerably well to-do.

"May I ask," continued the stranger, "how rich you are?"

"Well, if it will do you any good to know," was the reply, "I suppose I have several hundred thousand pounds."

"Well," went on the stranger, "if I were as rich as you and snored as loud as you, I'd take a whole car so as not to wake up other people."—*Exchange.*

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is one of the best and most practical systems for producing elbow patterns, for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow no matter of what diameter, number of pieces, or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

DAVID WILLIAMS.

PUBLISHER and BOOKSELLER,

96-102 Reade Street, - New York.

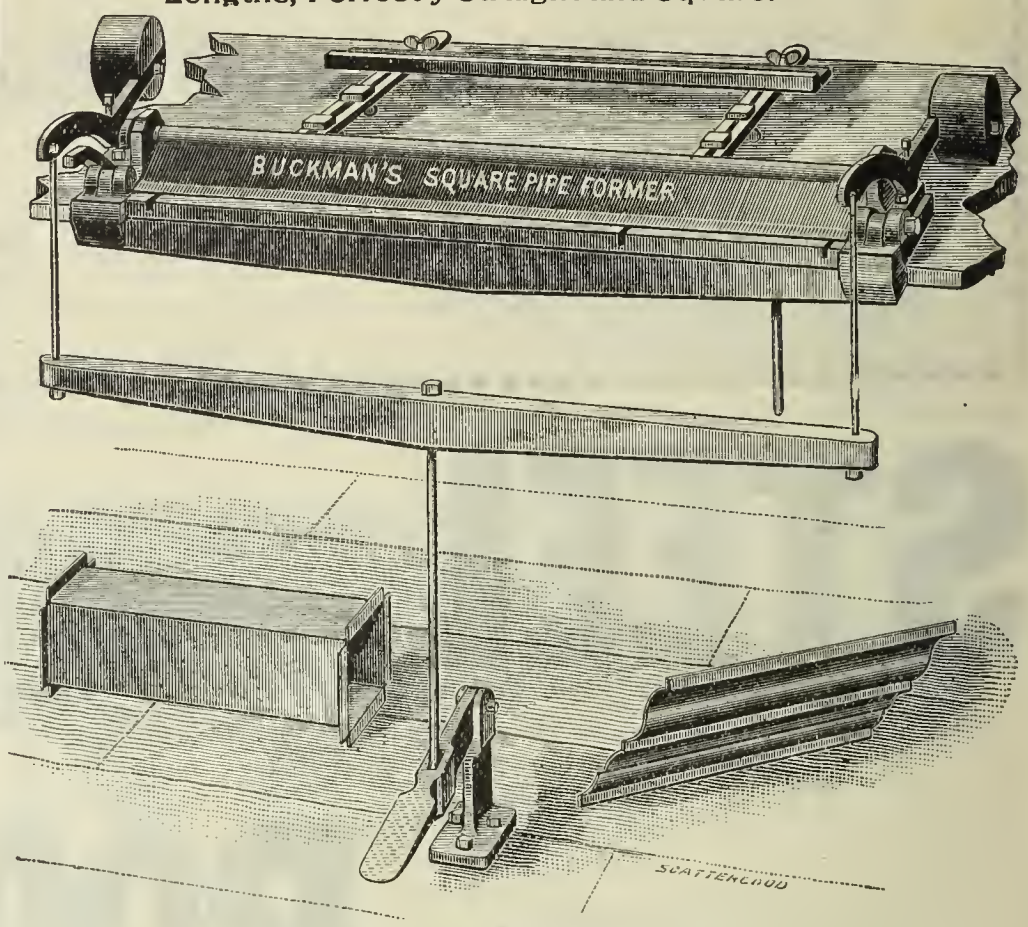
New Road Material.

At Hornsey, a London suburb, the dust of the district is collected and burnt, leaving considerable residue in the shape of clinker, and the coarser of this is found to make excellent material for road making and will easily sell at two shillings per load. The finer clinker is put in a mortar mill and, mixed with lime or cement, is used as mortar and grouting, but there is still a great deal left, and this, it is stated, mixed with a fair quantity of Portland cement, makes excellent paving stones at about half the cost of those purchased from the various patent stone makers. A section of Southwood lane, Highgate, at the entrance to the railway station, has been laid with this paving. It is said to be very hard and to wear exceedingly well.

— A CONTRIBUTION ENTERTAINMENT.—An amusing incident of a recent service in a London church is given by the *Telegraph*. The young man who carried around the plate put a shilling into it, as he supposed, before starting. The congregation included many young and pretty girls, who, as they looked on the plate, all seemed astonished and amused. The young man then for the first time cast a glance at it himself and found that what he had taken from his pocket was a conversation lozenge, with the words: "Will you marry me?" in red letters staring everybody in the face; while one of the girls had capped it by a second lozenge on which was printed: "Name the day."—*Exchange.*

— FARMER: "I bought some stock in that Western land company."

Broker: "Wasn't it watered?"



Farmer: "That's what I understood, but they've been assessing me like the mischief for irrigation purposes."—*Detroit Free Press.*

ADDISON L. ROOT, Manufacturer,
PALMYRA, NEW YORK.

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstration is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

PRICE, POST OR EXPRESS PAID, $5.

THE KEENE FOOT POWER

CORNICE BRAKE.

EASIEST TO OPERATE, STRONGEST AND BEST.

Sheet Metal Working Machinery of all Kinds.

GEO. C. KEENE & CO.,

Cincinnati, O.

AGENTS:

Hibberd & Spinner, 9 Cliff St., New York

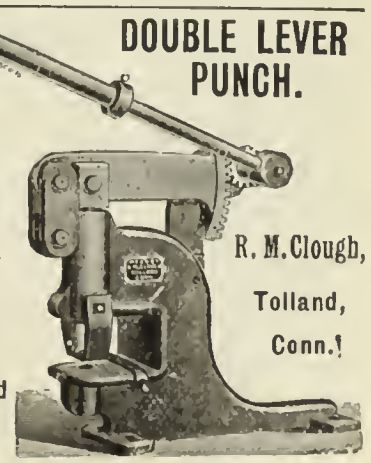
Holder & Herrick, 49 Broad St., Boston, Mass.

Ledwidge & Co., 234 Lake St., Chicago, Ill.

PRESSES, DIES AND TOOLS

For Can and Tinware Manufacturers.

Dies for Cutting, Drawing & Stamping Tinware



Estimates given at sight of samples of drawing work.

Send Sample for Prices before ordering elsewhere.

DOVER MACHINE WKS, Dover, Del.

DOUBLE LEVER PUNCH.

Capacity, ½ in. hole in ¼ in. Iron.

Send for Circular and Price.

R. M. Clough, Tolland, Conn.

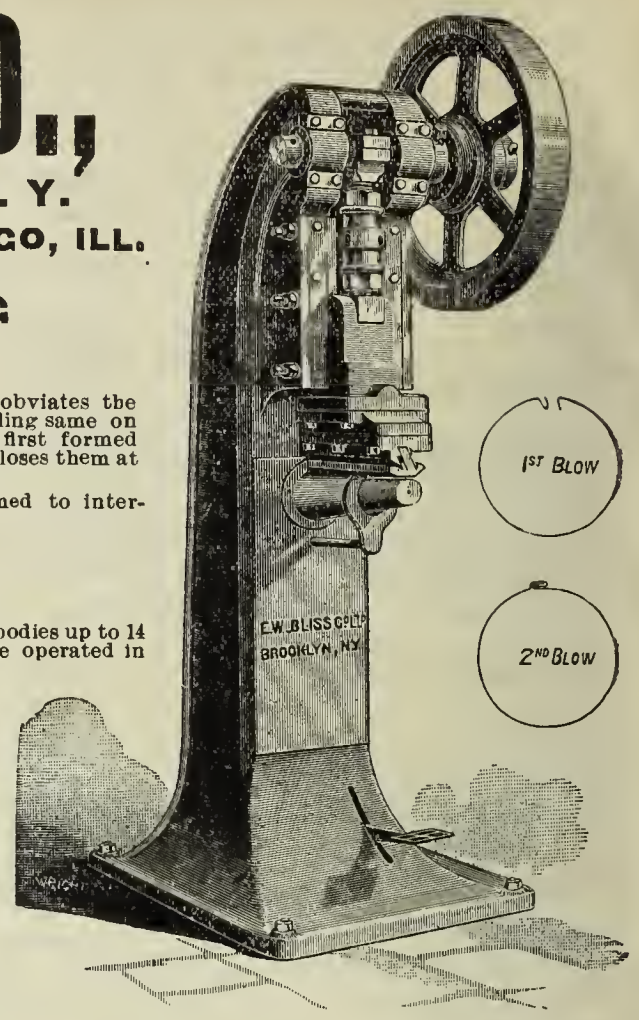
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



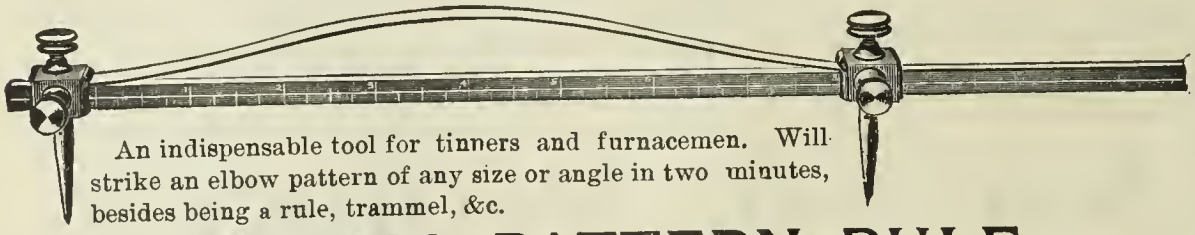
First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.



PRESSES, PUNCHES, SHEARS,

DROP HAMMERS,

DIES, SPECIAL MACHINERY &c.

THE STILES & PARKER PRESS CO.

An indispensable tool for tinners and furnacemen. Will strike an elbow pattern of any size or angle in two minutes, besides being a rule, trammel, &c.

"MAGIC" PATTERN RULE.

Price Reduced to $3.50 Net Cash.

Complete with Chart. Will pay for itself in a short time.

Send for Descriptive Circular.

LUFKIN RULE CO.,

SAGINAW, MICH.

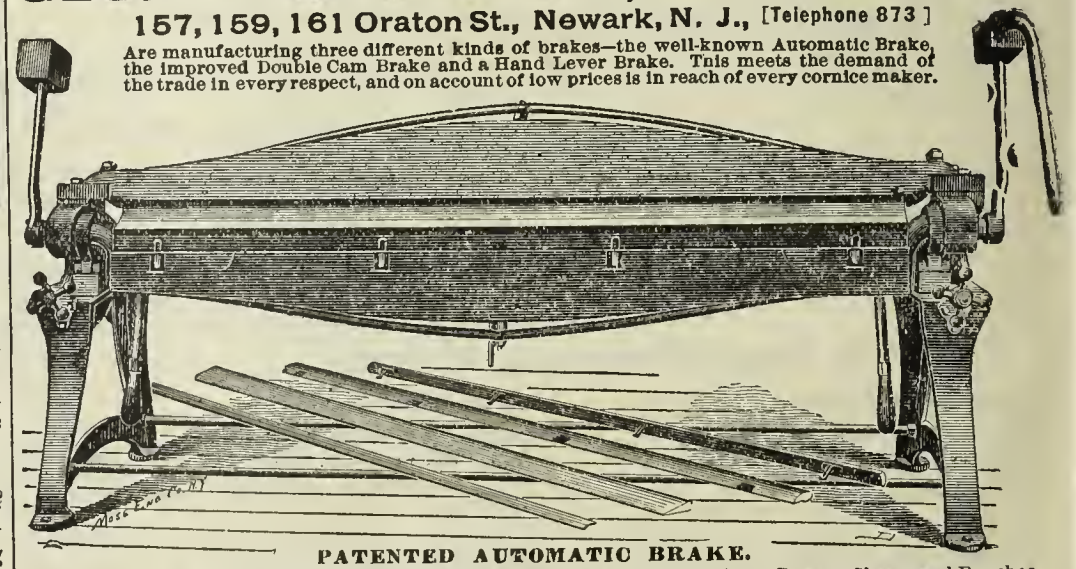
— AN IMPORTANT MATTER WITH HIM.—Policeman (at entrance to burning building): "Where are you going, young man? Don't you know you'll be suffocated if you go into that place?

Chollie Wobbles: "I want, my deah fellah, to tell the firemen to throw those mattresses out of the window of that third floor front."

Policeman: "Why are you a fool, man? The idea of talking about saving mattresses at a time like this. What's wrong with you?"

Chollie: "But, my deah fellah, it's just this way, dontcher know; I had my trousers between those two mattresses getting pressed out."—*Pittsburgh Dispatch.*

— NO CAUSE FOR WONDER.—Mrs. Cawker: "I wonder why drum majors wear such frightfully big hats?"



Mr. Cawker: "You wouldn't if you could once see the size of a drum major's head."—*Life.*

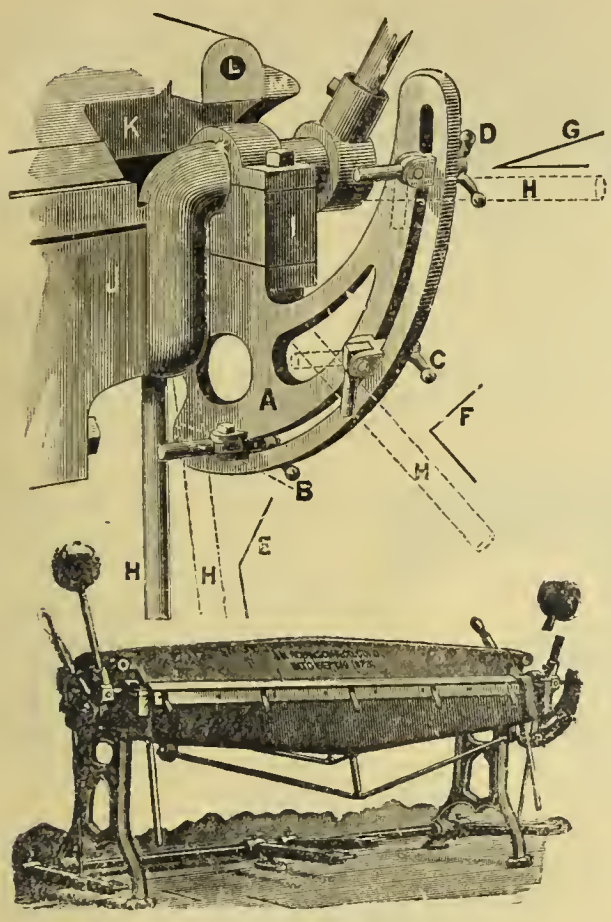
GEO. A. OHL & CO.,

Successors to the Calvin Carr Cornice Machine Co.,

157, 159, 161 Oraton St., Newark, N. J., [Telephone 873]

Are manufacturing three different kinds of brakes—the well-known Automatic Brake, the improved Double Cam Brake and a Hand Lever Brake. This meets the demand of the trade in every respect, and on account of low prices is in reach of every cornice maker.

PATENTED AUTOMATIC BRAKE.



We also manufacture Circular Machines, Squaring Shears, Slip Rolls, Drop Presses, Shears and Punches, Scroll Shears, Brace and Wire Benders, and all machinery used by sheet-metal workers. Special attention called to our improved Hammering Machines, patented December 27th, 1892. Send for our illustrated catalogue.

PATENT AUTOMATIC CAN BODY SEAMERS.

COMBINATION Presses and Dies,

SHEET METAL TOOLS, &c.

W. J. GORDON, 218 New St., **PHILADELPHIA, PA.**

THE PRINCIPLE UPON WHICH A CORNICE BRAKE

operates has much to do with its effectiveness. As this point was mainly considered when building the "Globe," we believe that in view of the large number in use, our Brake embodies more features of excellence than any other on the market. In this connection it may interest you to learn that we are the Pioneers in the manufacture of Cornice Brakes (36 years), and the knowledge gained concerning the requirements of a machine of this kind has enabled us to produce a tool that we believe to be perfect. TRADE  MARK.

MANUFACTURERS OF

PATENT PLANISHED SHEET IRON.

PATENTED:

December 10th, 1878.	March 4th, 1884.	August 31st, 1886.
January 10th, 1882.	April 15th, 1884.	January 1st, 1889.
January 1st, 1884.	June 10th, 1884.	January 17th, 1893.
February 12th, 1884.	January 6th, 1885.	

Guaranteed fully equal, in all respects, to the IMPORTED RUSSIA IRON. Also WOOD'S SMOOTH FINISHED SHEET IRONS and SHEET STEEL of different qualities CLEANED AND FREE FROM DUST.

General Offices and Works, McKEESPORT, PA.

Branch Office, 111 Water St., Pittsburgh, Pa.

HAMILTON'S

BEST REDIPPED AMERICAN ROOFING TIN

is DIPPED AND REDIPPED by HAND, and is NOT coated by machines through ROLLS like some plates that are lauded so highly by the makers, and the coating on Hamilton's Best Redipped is as heavy on the TOP half of the sheet as it is on the BOTTOM half. You have scales, test it. We can furnish machine coated plates with 20 lbs. of coating to the box of I. C. 20 x 28 at $11.50 per box, fully equal to any of the so-called extra coated plates.

JOHN HAMILTON,
PITTSBURGH, PA.

McCLURE'S REDIPPED

ROOFING TIN.

AMERICAN MADE.

The finest and heaviest coated Roofing Tin made; guaranteed to contain **35 lbs. Coating** per 112 sheets.

A very important point in a Roofing Plate is to secure a uniform coating; **McClure's Redipped** is made by a process by which the coating is distributed **evenly over the sheet,** leaving no thick edges which are found on other "OLD STYLE" or "REDIPPED" plates, and which interfere to a great extent in working the sheets.

McClure's Redipped has been thoroughly tested and found to be of **superior quality** to any other "OLD STYLE" or "REDIPPED" plate made. A sample box will substantiate our claim.

Apollo Best Bloom

There is great difference in galvanized iron.

You can always get flat sheets and workable iron, if you buy of a first-rate jobber. No jobber that has any careful trade could hold it without the Apollo brand.

There are three reasons for selling common iron: (1) it costs less by the ton, and generally is sold for the same in small quantities; so the profit on it is greater; (2) it is good enough for some uses; (3) and many metal-workers don't know the difference.

The difference is: the Apollo is flat (no buckling) and soft (no breaking when bent) and true to gauge—(no loss in buying by weight and selling by measure.).

SOMETHING NEW AND STRIKING:

The Royal Excelsior Ranges!

Eighteen Sizes and Varieties.

(Cut shows Six-Hole Range With Reservoir, High Hot Closet and Cup Brackets.)

These goods will set your trade in motion this spring and keep it going indefinitely.

See Description on Opposite Page.

ISAAC A. SHEPPARD & CO., { PHILADELPHIA, PA. BALTIMORE, MD.

MANUFACTURERS.

Admirable Trade Accelerators!

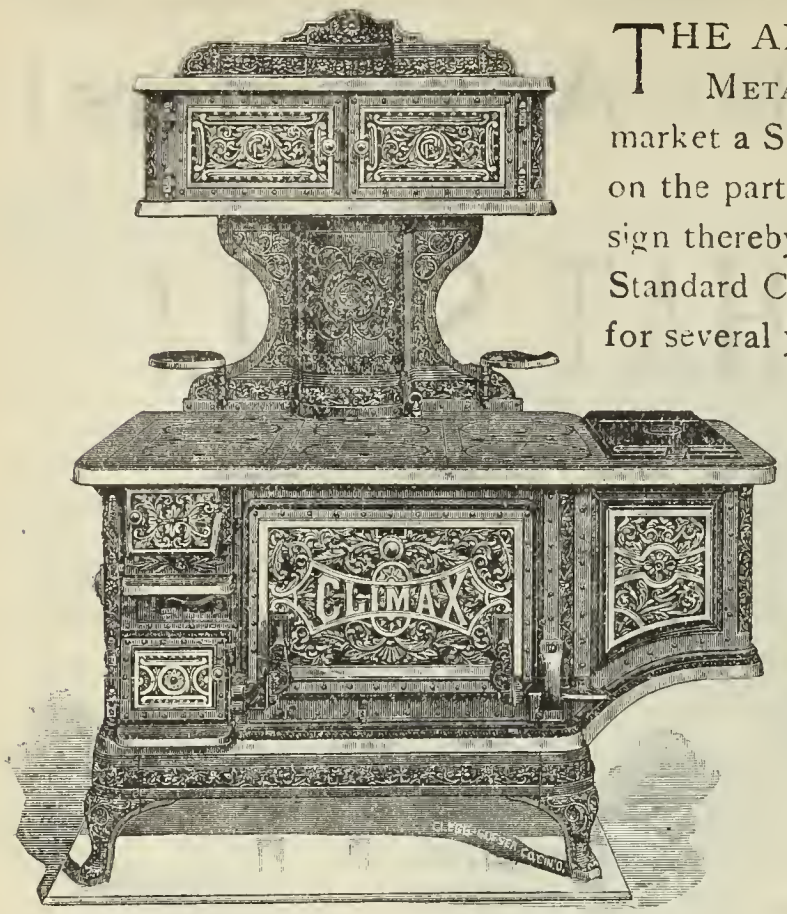
RANGES THAT SELL!

To sell goods now-a-days they must fairly bristle with good points. When Mrs. Noah moved out of the ark and set up housekeeping on Mount Ararat, she might have been satisfied to bale out hot water from an encased reservoir with a dipper (always spilling some on the stove top, of course), but modern housekeepers prefer to draw it off through a spigot, as those who use the **ROYAL EXCELSIOR RANGES** do. (This is our own patent. That is why you don't find other manufacturers using it.) Then there is also our "**ECLIPSE COVER,**" Three points: 1. Shape makes it strong—no place in it for a crack to start. 2. Cover lifted ***at center of gravity,*** the easiest possible way to lift a weight. 3 Cover lifted at once ***from any position***—no pulling or pushing it around to bring lifter hole toward the operator.

Eclipse Cover.

Patented December 29, 189 .

Damper easily replaced through pipe collar, having no rods to warp or burn out. Large end Hearth, sliding forward. Deep, roomy Ash Pit, Bailed Ash Pan, &c. Fire Box fitted for Wood, or Hard Coal, or Soft Coal, as desired. Grates quickly removed without disturbing Fire Box Linings. Cross pieces so arranged as to bring four boiler holes directly into contact with the fire. Water Fronts for all sizes, with connections taken from the back to either right or left of range, so that circulating boiler may be used on either side. The Feet are independent of the Skirt Base, which bolts to the feet after the Range is set up, thereby enabling one man to put the entire apparatus in place. The design is the work of a superior artist. All edges are beautifully ornamented, and will look well as long as the range lasts (Ground edges are hard to keep from rusting while goods are in stock, and turn blue and lose their good looks at the first fire. The ornamented edge is one of the greatest improvements of modern stove making.)



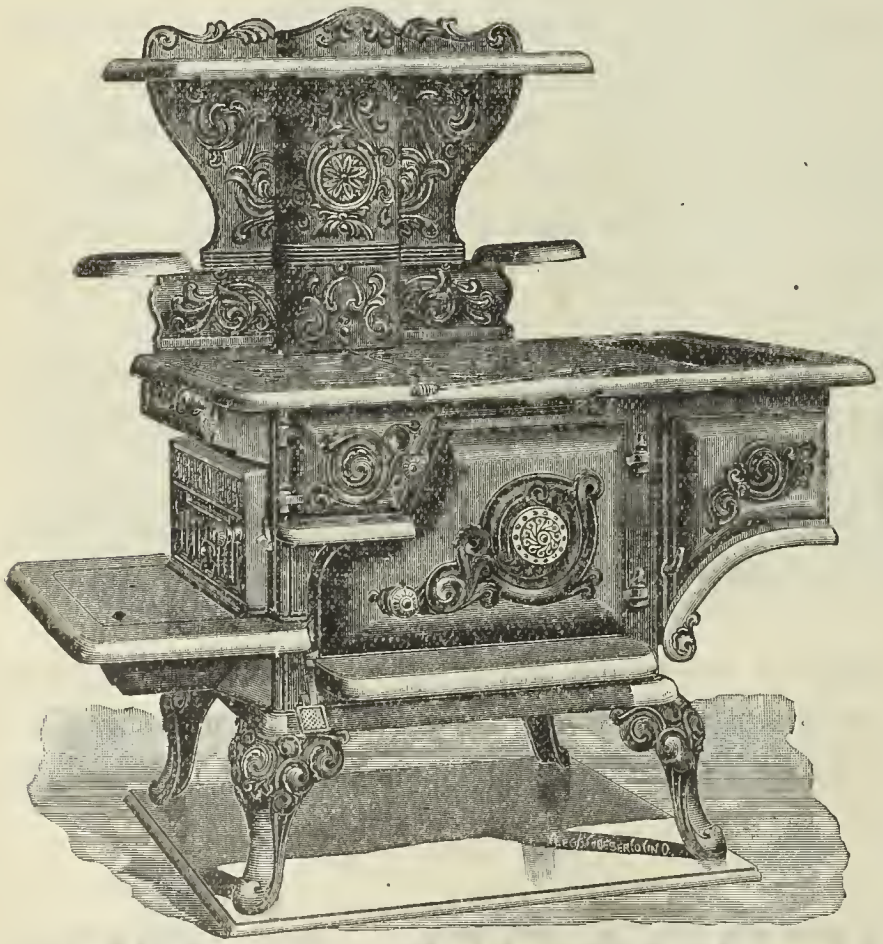
The mounting and fitting are of the best, and the added features of Nickeled "Alaska" Knobs, Nickel Name Plate, Nickel Oven Door Panel with Tile Center, Nickel Hinge Pins and Nickel Oven Door Pedal enhance the attractiveness of the goods

We cannot tell you all about these goods in a moment. Send to us for a descriptive and fully illustrated catalogue-circular. They are made with either four holes or six holes on top and with or without Reservoir.

If you buy one of these ranges, blacken it nicely and put it in a conspicuous place on your store floor, and within 30 days you are not satisfied with it, you may send it back at our expense. (If you keep it over 30 days, of course it's a sale.) Does this proposition strike you as fair?

ISAAC A. SHEPPARD & CO.,

Philadelphia and Baltimore.



THE ANNOUNCEMENT in a recent issue of THE METAL WORKER that we are soon to place on the market a Steel Climax Range having prompted the inquiry on the part of some of our patrons as to whether we design thereby to abandon the manufacture of our Celebrated Standard Climax Range, which has maintained supremacy for several years as an established leader of its class and against which not a single complaint has been filed in our office, we desire by this to inform the trade that the reputation of the Climax Range and constantly increasing demands for same is such as to preclude the possibility of abandonment if we felt disposed to do so. The Range, we are pleased to say, is more popular than ever, and the manufacture of same will be continued in all its varied conventional styles and sizes, and we sincerely trust that none will be deceived into a belief that an ***imitation*** now being offered to the trade is as good as the initial construction, which can only be procured of

"JUST AS GOOD AS THE AKRON 'AIR BLAST' FURNACE,"

AKRON AIR BLAST FURNACE.

Has become a familiar expression with the stove trade in many States.

Don't you want to make your competitors use it? Why it is so commonly used, is a Think to thought about.

WE ARE IN IT.

The past extremely cold weather has clearly demonstrated that.

THE ORIGINAL AKRON AIR BLAST FURNACE and its many agents are strictly in the swim. There is no weather too cold for us.

After twenty-five years' experience with the best furnaces made our Mr. May was convinced by careful experimenting and studying that they were not built on scientific principles, and therefore he invented and six years ago perfected the "Air Blast" principle for burning coal, which he has applied to the Akron Air Blast Furnace, and it has been so successful in burning all kinds of fuel, especially soft coal, that it has completely revolutionized the furnace business, and all manufacturers of the best furnaces are now trying to imitate it. The Akron Air Blast Furnace is the original and leader. Others follow.

THOUSANDS of users are glad to testify to its merits and its economy.

HUNDREDS of dealers are happy with its success.

DOZENS of imitators are wondering how it took its place at the front in so short a space of time.

ONE special dealer we are desirous of informing as to why the Akron Air Blast Furnace has such a wonderful record. You we mean. Write us.

Build up your trade with a certainty. No need of making furnace work a hit and miss.

Can you equal the following record with the furnace you are selling?

We have hundreds of agents in Ohio, Indiana, Illinois, Iowa and other States whose experience is equal to this. Carload and duplicate orders from them prove that their trade is increasing.

76 Furnaces Sold

AND NOT ONE COMPLAINT.

THE

Akron "Air Blast" Furnace

Has proven a Record Breaker. Even in hard times our agents have been busy. You should secure agency at once and be in the race at the front.

READ THE FOLLOWING LETTER:

OFFICE OF
WELCH & HORTON,

NEW CASTLE, Pa., March 23, 1891.

Messrs. May & Fiebeger, Akron, Ohio.

GENTLEMEN: We took the agency of the Akron Air Blast Furnace late in the season of 1891, and have sold up to the present time 76 Furnaces, and have not had a complaint from a single furnace, which we consider is the best recommendation the furnace can have. Our furnace trade has been affected less by the hard times than any other line of goods we handle which shows that people always find the means with which to buy a good article.

The Akron Air Blast Furnace has established a reputation for itself through Lawrence County that other furnaces cannot overcome, and when they make a sale it is to parties who look at price and not the furnace. We know that we have the best furnace on the market to-day and our customers know it, too. Wishing you success for 1891, we remain, Yours respectfully

WELCH & HORTON.

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF
Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth,
Price, $1.00

The book is well got up and the information well given Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

Sent, post-paid, on receipt of price by

DAVID WILLIAMS, Publisher,
96-102 Reade Street, NEW YORK.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

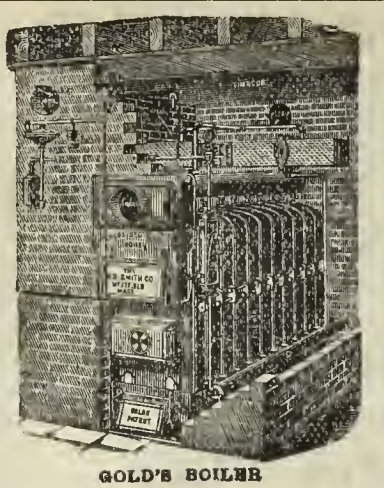
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

Sent post-paid on receipt of price by

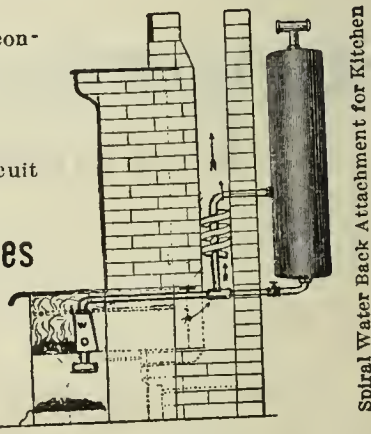
THE GLENMORE

Spiral Hot Water Generator.

(PATENTED.)

For General Heating Purposes, but Especially Adapted to House Heating.



COMMENDATORY POINTS:

Simple construction. Practically composed of two sections, consequently few joints and nothing to give out.
Large heating surfaces.
Products of combustion fully utilized.
Instantaneous generation of hot water.
Free and easy circulation.
Easily cleaned fire surfaces.
Hot water may be drawn off at any point along the pipe circuit without materially affecting the heating service.
Grate conducive to economy in fuel.

Spiral Water Back Attachment for Kitchen Ranges

By utilizing waste heat, this water back extends the capacity of a kitchen boiler, and makes it a valuable heating auxiliary, especially in spring and fall, when the regular heating apparatus is too powerful.

— He Was Tired of Calendars —A long, lean, lank man, apparently laboring under some strong motive for excitement, stepped into a prominent insurance office on La Salle street this morning and asked:

"Do you give away calendars for 1895 here?"

"Yes sir," answered the agent.

"Are they printed with great big, black letters, with red letters for Sundays and little birds flying all over them?"

"Yes."

"Is there a string tied to them so they can be hung up in front of you?"

"Yes."

"Got plenty of them?"

"We have any quantity of them, sir. Want one?"

"Are there mottoes at the bottom telling you about watching out for fires, and where to get insured, and all that?"

"Certainly."

"How many companies do you represent?"

"Six or eight. There's the old relia——"

"Never mind. Do all of them send out calendars?"

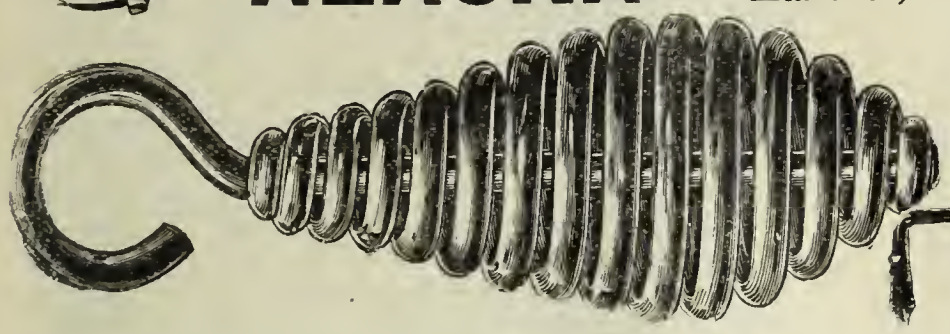
"Yes, sir, all except one, but——"

"Do you mean to say that you have one company that doesn't send out calendars and doesn't intend to send out any for 1895?"

"Yes."

"Then," cried the lank, long, lean man, feverishly, "that's the one I'm looking for. I want to insure my life for $50,000 in that company. I've had 47 calendars for 1895 from 47 different companies stuck on my desk since the beginning of this week and the worm has turned, sir—the worm has turned."—*Chicago Dispatch.*

—Highly Plausible.—Lady: "I don't believe this recommendation is from your last mistress; how did it get all those grease spots on it?"



Applicant: "Sure, ma'am, thim is the marks of the tears she shed because she had to let me go."—*Indianapolis Journal.*

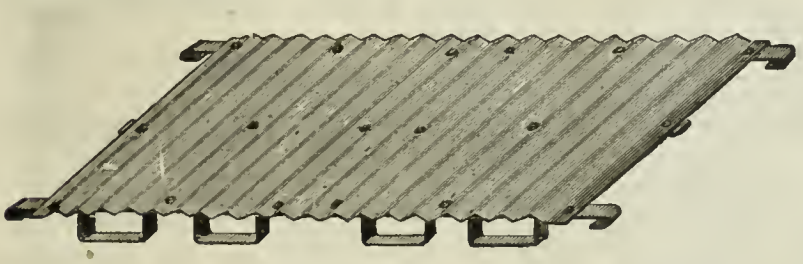
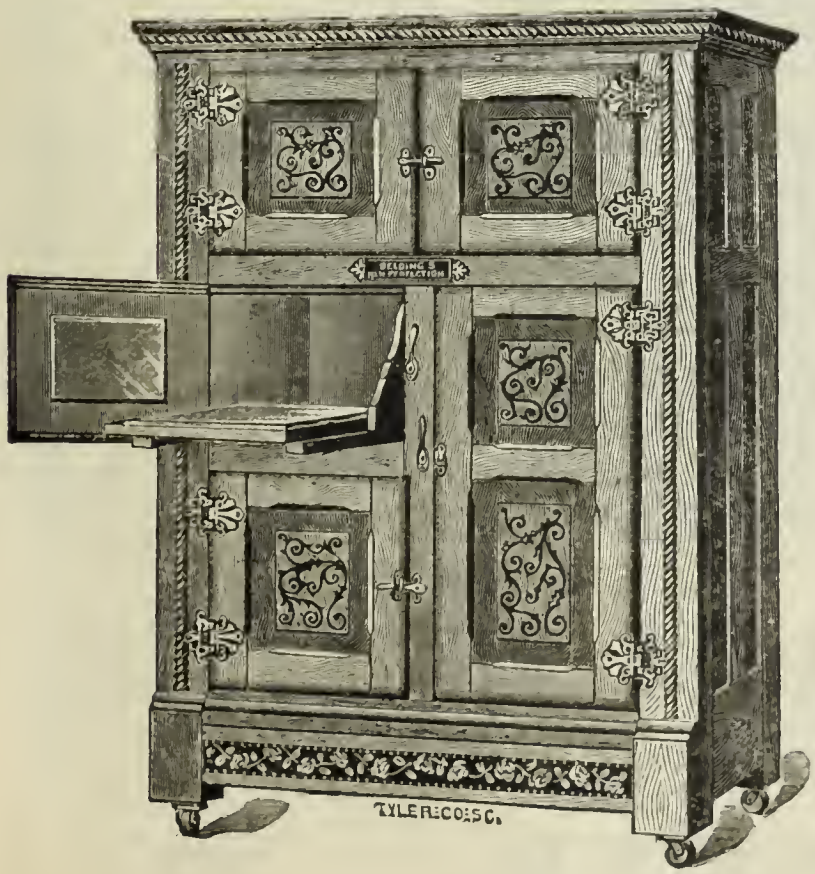
OUR NEW AUTOMATIC COLD AIR DAMPER ATTACHMENTS.



This cut shows a section of our Refrigerator with the New Automatic Cold Air Damper closed.

A—Represents Metal Ice Rack.
B—Bottom of Ice Compartment.
D—The **New Automatic Cold Air Damper.**
E—Door of Provision Chamber.

When the door of the Provision Chamber is opened the Cold Air Damper *immediately* closes the opening through which the cold air drops, thereby *instantly stopping the circulation* in the Refrigerator. Then, as the cold air in the Ice Compartment *cannot escape*, it is impossible for warm air to enter it through the flues in the sides of the Refrigerator; therefore, while the door of the Provision Chamber is open *no ice is wasted, no cold air escapes* and *no warm air enters* the Ice Compartment or *comes in contact with the ice.*



Thus it is clearly shown that this improvement is a *practical* one and makes our Refrigerators *consume less ice* than any that are now on the market.

OUR NEW DRIP CUP ATTACHMENT.

SOLID METAL ICE RACK.

No wood cleats to get water soaked and tainted.

All refrigerators **hardwood, antique finish.** We carry large stocks at all of the following places:

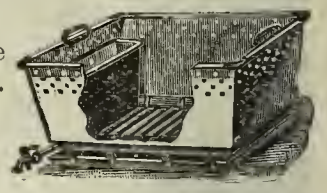
The Gurney Patent Refrigerator

is the BEST SELLER, gives the BEST SATISFACTION and PROFIT to the dealer of any refrigerator on the market BECAUSE—It has special FEATURES, "TALKING POINTS," SELLING POINTS, not found in other refrigerators.

1. By the use of a ***Removable Galvanized Ice Compartment*** the ***"Gurney"*** can be cleaned. This feature alone assures its sale.

2. Under the ***"Gurney"*** principles of construction the ***lowest*** average temperature is reached with the ***greatest economy of ice,*** as fully explained in our catalogue.

3. In the ***"Gurney"*** the ice does not come in contact with the zinc side walls, thus preventing condensation or "sweating" on the inside linings, an important feature of cleanliness and durability.



4. It is packed with Mineral Wool (the best non-conductor known).

5. It has the freest circulation and dryest air, there being a large space around the four side walls of the ice compartment, thus giving about six times the condensing surface of any refrigerator.

6. In style and finish it leads all competitors.

Unparalleled HEATING Capacity.

CUT SHOWING BOILER SECTIONS.

56 Beekman Street, New York City.

A GLANCE at the cut reveals the secret of the wonderful heating power of the **Hub Hot Water Heater.** It has an overhanging shell firepot to begin with, which is a powerful boiler in itself. Over this are five annular sections with inclined surfaces, over which the water glides in an easy upward movement without check or friction. The circulation is from the sides to the center and back again, four times repeated through these sections.

The HUB is the simplest of all Heaters. There are no conflicting currents, no complicated parts, and an ordinary workman can put the parts together in half an hour.

The HUB has no long list of failures on its record. Every one sold is a reference for it. Steam Fitters, Architects and clients alike will find it an apparatus embodying the most desirable features known to heating science. Our pamphlet on Hot Water Heating fully describes its principles and construction and the results obtained. Write us for terms and territory.

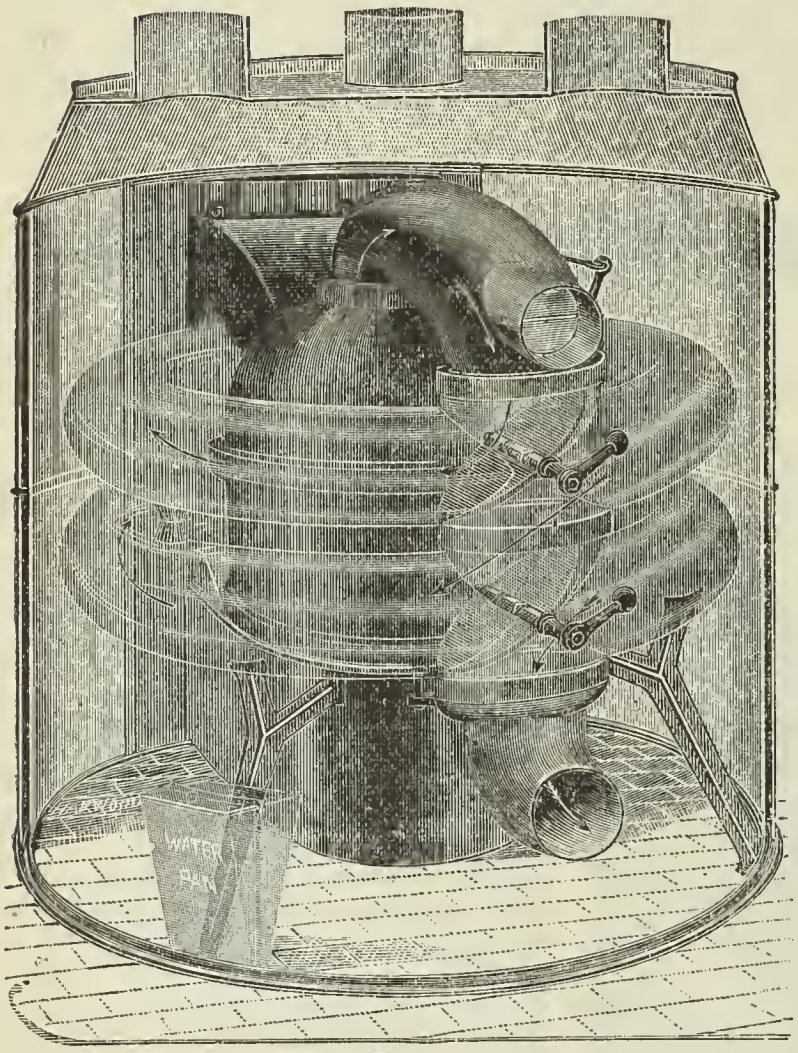
Curious Artificial Fuels.

The Patent Office at Washington, says an exchange, has at present a very curious assortment of contrivances patented for cheapening the cost of fuel. Some of the ideas are exceedingly interesting. One patent provides for using corn cobs soaked in petroleum, another would have people cut leaves and grass when green and press them into compact blocks. It is claimed for this particular patent that such blocks might be used for building and fencing without impairing their value as fuel. There are, besides, many devices for utilizing coal dust. One proposes to mix clay, molasses and water, coal dust and petroleum. Another mixture is that of sawdust, Irish moss, asbestos fiber and burnt limestone, these being boiled and made into bricks with coal dust. Then there is a patent for bricks without coal dust, to be composed of ashes and sawdust saturated with petroleum and coated with rosin. Among the most curious ingredients for artificial fuels are clam shells, charred garbage, corn meal, wheat flour, sugar, seaweed, broken glass, lard, tar and leaves.



One of the most interesting of these contrivances is composed of powdered charcoal and finely cut cork. The fuel burns very slowly and gives off a great deal of heat, being particularly well adapted for the sick room. Exclusive rights have been taken out for the manufacture of a brick or cartridge of highly porous clay, which is to be soaked in kerosene and put in the kitchen stove when wanted. It is only necessary to touch a match to this and the fire is ready for cooking. None of these, however, are more ingenious or economical than a fuel which is reported to be in use at present in Egypt. In this case Egyptian mummies, chiefly those of cats, ibises and other animals held sacred by the ancients are employed.

Quality of Tin Roofs.

We commend to the attention of all of our readers who are interested in the subject of metal roofing a letter printed in our correspondence department of this issue from a firm signing themselves "Experience." The question touched upon is a vital one for the continuance of the tin roof trade. The inspiration of the communication was a letter we recently published in which occurred the statement that tin roofs could be put on at a profit at four cents per foot, and also that gravel roofs were largely used in the district in the South from where the letter was written. The communication to which we direct attention comments very seriously and earnestly on the present situation. The writers point out that it is no wonder that gravel roofs are being specified when the normal metal roof is a four cent a foot roof. At that price they say that only a waster can be used, and a waster furthermore of a very poor quality. We need not go over all the points of the letter, but we mention it here that attention may be directed to it. The argument of the whole communication is against the use of too cheap plates. The subject of acid made plates as against palm oil process ones is touched upon, and the sensible advice is given to the trade that the property owner should be educated to appreciate the value of a good roof and to demand it; that competition be not permitted to run on recklessly to the utter destruction of the trade in good plates, but that the house owner be taken into confidence and persuaded that his best interests are served by putting a little more money at the outset into the roof covering. We wish this subject might start correspondence from other persons in the trade, both dealers and roofers, for the benefit from such a discussion would inure to all concerned.

The Kitchen of the Future.

In the designing of buildings intended for living purposes one of the features which often fails to receive the attention its importance warrants is the kitchen. The idea seems to prevail in many quarters that this department of the household can be located almost anywhere without much regard to light, ventilation or convenience of access. It may be stated without fear of contradiction that in a majority of the flats and apartment buildings of the large cities of the country, and frequently in private houses as well, the kitchen occupies a damp basement or remote corner of the building, with little or no provision for ventilating the room of the vapors arising from cooking, and often so dark that it is necessary to keep the gas lighted during the day as well as at night. Under such conditions it is not surprising that the lives of cooks are short compared with those engaged in other indoor occupations. The many and serious objections urged against this condition of things in the course of time caused efforts to be made to remedy the difficulties. Some of the results are seen in connection with a few of the more expensive apartment houses, hotels and clubs, where the kitchen is located at the top of the building. In this position there is an abundance of light and ventilation, while the odors and vapors arising from cooking operations can be readily carried away, without annoying the occupants of the floors below. Ever since this plan was tried some little thought has been given to applying the feature to private houses. It is as yet in an experimental stage, but probably when electricity becomes more generally employed for domestic purposes, the kitchen at the top of the house will be regarded as common practice.

Sanitary Aspects.

Apropos of the above it is interesting to note that the Society of Cooks in Paris lately secured the services of an eminent physician to investigate the causes of the alarming mortality in their profession. He declares that the kitchens of Paris are the foulest portions of the houses, and that their occupants are subject to a multitude of disorders, which would be immensely reduced if the kitchens received a proper supervision on sanitary lines. One of the remedies proposed consists in increasing the size of the kitchen and removing from its vicinity larders, scullieries, sleeping rooms and water closets. A writer discussing the principles of kitchen sanitation states that "they can be applied to any house by a little study of material at hand. Oil cloth or linoleum should cover a wood floor, zinc or oil cloth should be placed over shelves and tables, and every vestige of carpet or rug relegated to some other place from that in which the food is prepared. Better, of course, than all this is to have put in new floors and walls of tiles or marble in the kitchen or pantry. Expenditure here would be of greater value than in the parlor if both could not be afforded."

Some American Kitchens

In marked contrast with the French kitchens, as well as some to be found in many German houses, are those of many of our modern American homes, where vaulted roofs, swell ends that take up the greater portion of the back yard, tiled or marble walls, inlaid floors, open plumbing and the latest features in ventilation make the word "kitchen" a poor term to apply to these places. In a beautiful mansion recently completed in this city the kitchen has a ceiling fully 15 feet in hight; the floor is inlaid with chips of marble, the walls are tiled and there is scarcely a strip of wood to be found outside of doors and frames of the china closets. Under a set of cupboards, which stand perhaps 3 feet from the floor and are 10 feet wide, the space is lined with marble and fitted with marble shelving. Every corner of the kitchen is light, the water pipes run outside the walls in stacks of six and eight lines and the nickel plated stop cocks are readily accessible at all times. In the butler's pantry adjoining are marble shelves, tiled wainscoting, inlaid floors and tables covered with zinc for draining dishes and keeping food while serving the table.

This is beyond question the era of mammoth department stores. Announcement is made of the completion of arrangements whereby the well-known Chicago dry goods firm of Siegel, Cooper & Co. will erect this summer in New York City a huge establishment of this kind uptown, which will be larger and more complete than any similar undertaking in the world, not excepting the Bon Marché in Paris and Whiteley's in London. The firm have purchased and acquired on long lease a property occupying one-half of an entire block on Sixth avenue, between Eighteenth and Nineteenth streets, the plot of ground having an area of 85,560 feet. The cost of the ground and buildings is estimated at not less than $4,000,000.

The passing out of existence of the Fifty-third Congress of the United States, on Monday, was contemplated with unfeigned satisfaction by the public at large.

THE LETTER BOX.

Cold Air Box and Filter.

From C. E. S., *Wheeling, W. Va.*—In perusing the columns of *The Metal Worker* the inexhaustible and probably seasonable question at the present time (the cold air box) bobs up serenely with curious antics. Our friend "J. L" of Pittsburgh in *The Metal Worker* of February 2 says, referring to his cold air duct, "if under the influence of some winds the hot air is inclined to be discharged out of the cold air box," &c. I would merely ask what causes some winds to come out of the cold air box? I think "J. L." has a very convenient duct, and if he wants to filter his air I think he can get good results by enlarging his duct from the bottom of the sash to the floor to about five times the original size arranged along the wall to suit convenience. He should then provide a series of three or four vertical slots provided with necessary guide strips. He should then make corresponding frames covered tightly with cheese cloth and insert them in the slots, thus closing up the cold air box. It is better to have a general door so that these can be taken out and dusted off about once a week or more as needed.

Why Did It Collapse?

From H. S B., *Oswego, N. Y.*—Will some of the readers of *The Metal Worker* state if they ever had a water boiler collapse? I have just had such an experience with a boiler made of copper that was considered first class. It occurred in the day time and was nearly full at the time. It assumed a shape resembling an hour glass. What was the cause of the collapse and the loud report?

Note.—We shall be glad to have our readers discuss this subject. The source of water supply not being known it is fair to assume that it is not very strong in pressure, as the boiler does not seem to have been reenforced to withstand either inward or outward pressure. Under such conditions heavy firing would generate steam to an extent that water would be forced out of the boiler back into the supply pipe. If the boiler became partly filled with steam and then the steam condensed instantly, a partial vacuum would result before water in sufficient quantity could enter to fill it. These conditions would bring a heavy pressure to bear on the outside of the boiler, which being made of light copper would collapse. Another cause that might effect the collapse in siphonage. If a faucet on the system below the boiler was opened when the supply was temporarily shut off it would draw the water from the boiler by siphonage if there was no hole at the top of the delivery tube in the boiler or it had become closed. Then as soon as the boiler was partly empty the pressure of the atmosphere of 14 pounds to the square inch on the boiler would cave it in. A safety valve which will permit steam to escape when a pressure stronger than the supply pressure was developed would overcome one trouble, and a vacuum valve that would open to let in air in case of siphonage would dispose of the other. Some correspondence on this subject will be found in *The Metal Worker* of February 10 and March 3, 1894. It is also treated in "Kitchen Boiler Connections."

A Few Remarks on Ventilating and Cold Air Supply for Hot Air Furnaces.

From M. I. C., Jr.—The ventilating system and cold air supply of the present time are about the only drawbacks that the manufacturers of furnaces have to contend with. How many furnaces are condemned on those very accounts. Where good results are not secured it is always laid to the poor working of the furnace, while, if the cause of the trouble was looked into by some one experienced, it would be found, in nine times out of ten, that it was in the poor ventilation of the building and the cold air supply to the furnace. How many times will we see a church or a private building where the furnace obtains the supply of cold air from the cellar or the floor above heating the same air over time after time until it becomes so foul in the room that a window or door is opened to let in fresh air. Some think that the furnace is being run too hard, which is not the case. It is the constant inhaling and exhaling of foul air and heating of the same air over and over again. In order to have a constant supply of both warm and fresh air we must take the cold air from outside the building and not from the damp cellars or from floors, where many of the impurities of the air settle. We must have ventilating flues built in the walls, and by placing openings into them as near the floor as possible provision is made for the foul air to escape, which will permit a constant supply of both warm and fresh air to enter. A building that is well ventilated is already half heated before starting a fire in the furnace. Why is it not just as necessary to have a system of ventilating and make provision for a supply of fresh cold air from outside the building as it is to have a system of plumbing?

Wants Cement for Marble and Basins.

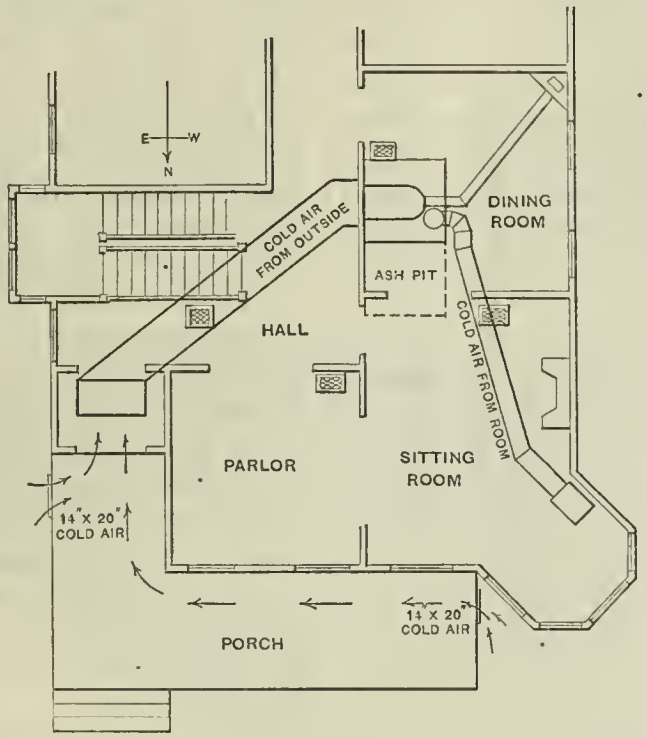
From E. S. N., *Westminster, Md.*—Will some reader of *The Metal Worker* tell me of a good cement for joining marble and basins to marble slabs? I have used putty and several other materials mixed with oil, and they leave a dark oily mark on the marble. I have also used plaster of paris, which breaks out quickly and is of no value. I shall be glad to see a good cement given by some one who prizes The Letter Box.

Frozen Wind Mill Tanks.

From G. D. H., *New York.*—In answer to "W. A. F.," Matawan, N. J., whose letter appeared in *The Metal Worker* March 2. The exposed bottom sections of wooden tanks favor the loss of heat in freezing weather by their water soaked condition, which makes them good conductors, making their exposure nearly equal to iron tanks for liability to freeze in very cold weather. The freezing during very cold nights is also promoted by the disuse of water and its quiet condition in the tank and pipes. For a temporary expedient for preventing freezing the water should be allowed to waste slowly during very cold weather and the mill allowed to run to supply the waste. If the mill is a self regulating one, it will take care of itself with one bibb in the house partially open. The severest weather of the past season has been on windy nights, when wind mills will run strong and allow enough waste to prevent freezing in tank and pipes. This method is largely practiced in extremely cold weather for protecting exposed water pipes to the discomfort of water supply companies. As a permanent relief, the only safety is in protecting the tank and main pipes thoroughly, which can be done by a tight board ceiling under the tank bearing beams, filling the spaces between the tank bottom and ceiling with hay or other non-conducting material and closing up all outside openings beyond the line of the stoves and also by increasing the thickness of the covering on the pipe. For ordinary winters in this latitude, this should be sufficient protecting; for colder latitudes, the whole tank should be housed in, as is recommended for iron and steel tanks. All tanks should be covered with a wind tight roof.

Wants to Remove Letters from Glass.

From F. B. H., *Aberdeen, S. D.*—Will some reader of *The Metal Worker* inform me how to remove metal buttons from a plate glass window which have been cemented on with Stratena, without injury to the plate?



Heating From Range.

From H. L E., *Wahpeton, N. D.*—In *The Metal Worker* of February 23 I see a communication from "B. M. C.," Hoboken, N. J., in which he claims that a three-story house is heated from a range and small boiler. If he can give me the size of the boiler, position as respecting range and manner of placing coil, I will consider it a great favor. I am interested in any system of hot water heating which will give satisfactory and economical results. I am afraid his system would not give satisfaction during 40° below zero weather such as we have here.

Note.—We will be glad to illustrate and describe the system mentioned by "B. M. C.," and hope he will furnish the material.

A Peculiar Furnace Experience.

From C. S., *Cleveland, Ohio.*—We placed a furnace in a house in our city six years ago, and a furnace never worked better. This year the owner felt cold drafts in his sitting room at the floor. We informed him that we could draw the cold out of the room by putting a register in the floor and running a pipe from it to the furnace chamber. We did so, as shown in Fig. 1, which is a plan showing the sitting room and exhaust pipe. The pipe works the opposite of what we expected, however, and sends warm air into the room. The furnace has ten hot air pipes: two 12 inch, two 10-inch, three 9 inch and three 8-inch, all taken from the top, as shown in Fig. 2, which is a sectional view. The furnace is supplied with cold air by means of a duct leading from under a veranda, which has 14 x 20 inch openings at the east and west ends, and which has the floor laid with spaces between the boards for the admission of more air.

A Peculiar Furnace Experience.—Fig. 1.—*Showing Sitting Room and Cold Air Pipe*

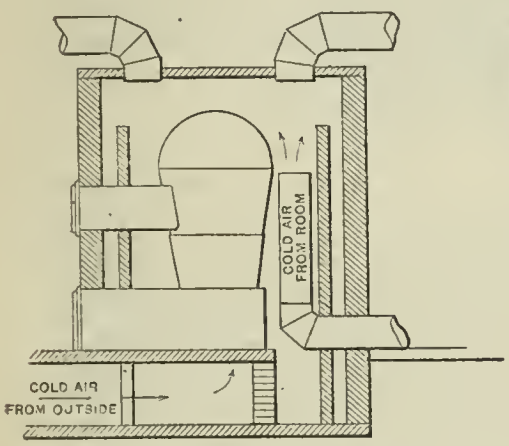


Fig. 2.—*Sectional View.*

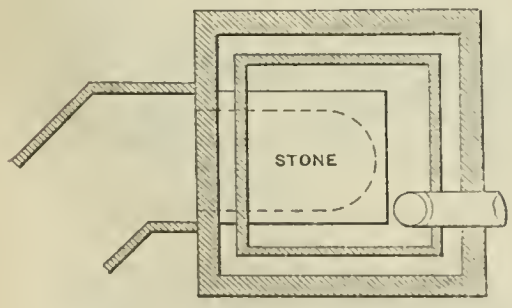

Fig. 3.—*Plan View of Furnace.*

The duct leads to a pit under the furnace, entering at the front under the ash pit, as shown in Fig. 3, which is a plan view. In using the furnace only three of the pipes are in use all of the time, two others are partly open and five of the pipes are scarcely ever used. One of the pipes that is not used leads to the first floor, all the others not used lead to the second floor. The room in which the trouble occurs is 14 x 19 feet, with a 10 foot 4 inch ceiling, and has a fire place in it. We placed a 14 x 20 inch register in the floor in the bay window, and ran a 14 inch pipe from it to the furnace, entering near the bottom and turning up 18 inches, but warm air came out of the register. We then added enough pipe inside of the furnace to bring the end up near the top of the chamber, with no better success. A section of the pipe was then taken off and a tapering piece, from 14 to 9 inches, was added, with a Globe ventilator on the top, but all of our experiments proved fruitless. The upright section of the pipe gets hot, and we cannot understand why the air in it does not rise. This is a very puzzling question to us, though it may be very easy to some of the readers of *The Metal Worker*, and we would be pleased to get their solutions of the problem.

Note.—This seems to be a perplexing problem, yet it is possible that some of our readers have met and solved it, and their method will be interesting to many. With a furnace having an area of 721 inches of hot air outlet it is fair to suppose that the cold air duct is of ample size, having an area of at least two-thirds of this amount, or about 480 inches, which will more than fill the pipes left open even before it expands. A cold air duct supplied as in this case would be less influenced by winds than is the general experience, so that the pressure of air on the furnace would tend to force hot air out of the exhaust pipe, as there is a fire place in the room in question through which a large amount of air could escape. It is possible for the air to pass down the short heating pipe in this room to the furnace and then air would readily flow in at the exhaust register. The pressure from the natural winds would be toward the heating register, and short circuiting as above described has been reported. By running the pipe up so high in the furnace it is easier for the hot air to enter it, though under ordinary conditions heating the pipe would aid in lifting the air. The exhaust pipe should not run along the cellar ceiling where it might become warm and hinder a down current of air. It should preferably have a down pitch from the register to the furnace, or drop down at once and run along the floor and enter the furnace low down. Often an exhaust pipe works better when the register is placed near or alongside of the heating register, when both registers may be located at some distance from the furnace if need be. We would suggest that the exhaust pipe inside of the furnace be removed and nothing left but the elbow. We shall be glad to have this case fully discussed.

A Roof Problem.

From C E S., *Wheeling, W. Va.*—I would like to see some discussion on the subject of roofing in reference to the possible leaks in double lock across seams. A contemplated improvement in a building here requires a new tin roof 40 x 120 feet. The owner complains about the many bills which he has paid in the past for repairing the cross seams on the present roof, which have been pulled apart parallel with the pitch of the roof. The roof is a standing seam roof, and he wants the difficulty above mentioned obviated in the new roof and objects to double locking on account of capillary attraction. He does not fear the leakage from such a seam so much as the breaking of the bend in the seams after it is once set, which will let in water to destroy the roof, which has not a very great pitch. I have suggested that the roof be constructed in sections of 20 feet each with one general pitch, each section having a vertical rise of 5 inches above the other, forming a series of steps. Then these offsets would compensate for the contractions. This suggestion has been ridiculed as impractical and I would like to have the subject discussed.

Will It Work?

From G. F. S, *Washington, D. C.*—In answer to the query of "F. L. M.," Roseville, N. J., in *The Metal Worker* of February 16, I would advise him to take a branch out of the top of the pipe from the water back to the boiler and put a stop cock between the branch and the boiler. Then run the branch up and over to the radiator, dropping down and connecting with it. An air valve must be placed at the highest point on the piping and a stop cock on the branch where it connects with the water back pipe. The return from the radiator should be run conveniently and connected with the pipe from the bottom of the boiler. By closing the stop

cock to the boiler and opening the other the circulation must go through the radiator. By reversing the manipulation of the cocks the boiler will be heated without heating the radiator. By opening both cocks a little both will be heated.

Arrangement of Hardware Store.

From GEORGE ROME & Co., *Carnegie, Pa.*—We send herewith a floor plan of a building we expect to fit up early in the summer and would be pleased to receive suggestions as to the best way of fitting this up for our own use. On account of the store being narrow we think of not using any counters, but using instead a wide counter shelf with a recess in the shelf for the scales. Our stock will consist of hardware, tinware, house furnishing goods, paints, stoves

Arrangement of Hardware Store.

and furnaces. We would also like to receive cuts and prices from manufacturers of screw and bolt cases.

The Quality of Tin Roofs.

From EXPERIENCE, *New York.*—Some two weeks since there appeared in your journal a letter from a Southern correspondent asking for information as to the lasting qualities of gravel roofs. He also went on to say that "where tin was formerly used in his section gravel roofs are now being specified;" and further makes an assertion that is somewhat remarkable, that "he can put on a good roof at 4 cents per square foot and make money out of it." Your correspondent's statement as to his using a quality of tin costing only 4 cents per square foot unfortunately exposes "the milk in the cocoanut," as any of your readers acquainted with the tin roof business would know (if they were aware of the location from which your correspondent writes) that it is an utter impossibility to buy even cheap prime plates, pay freight to destination and put them on the roof at the figure given by your correspondent. Indeed, to be able to make any profit at all (the quality of goods to which he refers has to be judged of course by the price which he states—4 cents per square foot, laid) he has to buy a plate either in Baltimore, New York City or Philadelphia that costs about $6 50 per box. Of course, it is needless to state that a plate at this price is a "waster" of the very poorest quality, and possibly containing holes over which paint itself would have no protective properties. Is it to be wondered at that with the use of such inferior and utterly disreputable material, gravel roofs—or any other kind of covering—would be substituted? Why is it that in the cities of Chicago, St. Louis and others, there are hardly any tin roofs? Your correspondent answers this question very satisfactorily himself when he makes a statement involving such a clear insight into just what class of material Southern cities have been afflicted with for such a long time. The citizens of St. Louis and Chicago have come to the same conclusion, and very wisely. It is simply the instinct of self preservation to obtain a covering that will at least shield them from the elements a reasonable length of time.

Being interested in the roofing business ourselves, we know that the use of inferior tin rests wholly with the property owner, the jobber and the consumer. There never has been a time when so many light weight and acid made plates have been used for roofing purposes as in the past four years. Competition has never been so severe and property owners never so reckless of their own interest as at present. The only cause we can assign for this is that they expect $1 worth of work and material for 60 cents. And besides, the price of roofing plates has been so materially reduced during the past few years by the introduction of what is known as the "acid flux process" that this class of material can be bought at a much less rate than any of the plates made by the palm oil process. If property owners could be taught to understand the difference in results between plates made by the acid process and plates made by the palm oil process they would be somewhat startled. Yet we do not think that out of every 100 boxes of tin plate sold to-day there are above three or four made by the palm oil process.

Years ago, competition among tin plate manufacturers centered itself on the quantity of coating that could be successfully placed on one sheet, which, by the way, was then put on by the palm oil process exclusively, acid being comparatively little known. Those who could show the heaviest coating were awarded the laurel. To-day everything is different. It does not so much depend on the amount of coating given a plate to determine its selling properties as on the price at which it can be profitably sold. We cannot blame property owners for using anything in preference to cheap tin—even gravel roofs. It is simply a matter of self defense. We do blame jobbers and roofers, however, for the present condition of affairs, and firmly believe that if the better class of roofers would only take the trouble to educate property owners to understand that but a fraction of a cent per square foot exists between a thoroughly reliable palm oil made plate and a plate made by the acid flux, they would appreciate the hint and act accordingly. It would have the tendency to at least lessen the fierce competition, while property owners would be willing to pay a little more for their tin when the result of its use could be clearly shown.

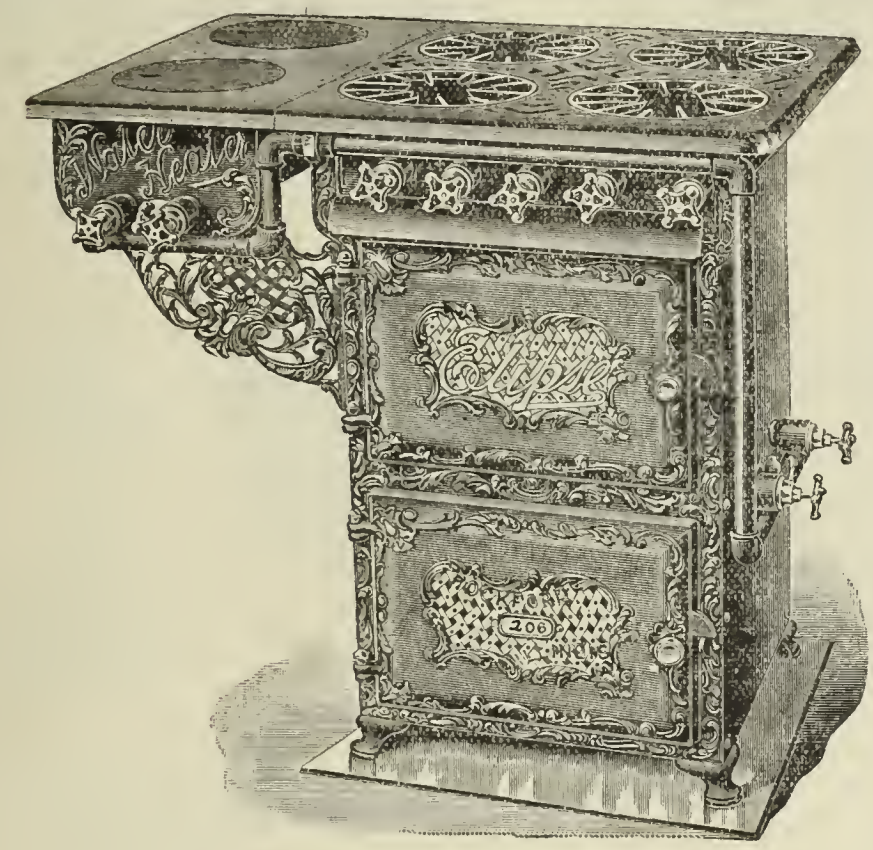
Of course, the fact that there are a great number of firms doing a large business who are placed in a false light by the present condition of affairs is fully appreciated, and although it may not at present be realized, there will be many of them in a few years like Othello, whose occupation will be gone. Again, do they stop to realize that this incessant warfare of prices simply means carrying on business for the fun of it? Sacrificing quality to price is suicidal, and generally ends in oblivion. We are sure *The Metal Worker* will bear us out in the assertion that not one firm can be pointed out—whether jobbers or roofers—who ever made a success in dealing exclusively in cheap and disreputable goods. It is in direct opposition to the law of natural worth. Yet we know for a fact that some of the old style plates nowadays which are supposed to be made by the palm oil process are made by acid flux in order to cheapen the cost of production and compete with the more reputable brands of palm oil manufactured plates, regardless of the welfare of the house, the roofer or the property owner.

In conclusion, we can only say that your correspondent has given the key to the whole situation, that until property owners are taught to understand that cheapness is not the first requirement (in roofing plates, at least), nothing but constant expense and new roofs will be the order of the day. And we will venture the prophecy that if acid plates are put on as recklessly in the next four years as they have been in the past, the cheap tin plate will be utterly abolished and a substitute introduced more favorably adapted to atmospheric action and the length of the buyer's purse.

Lining Slate Tank.

From E. S. W., *East Wallingford, Vt.*—One of my customers here has a slate tank, 26 inches square by 3 feet deep, which he uses for holding hot water. The expansion and contraction caused by the hot water becoming cool opens the joints, causing the tank to leak; consequently the owner wants the tank lined. Now, I would like to hear from *The Metal Worker* readers as to what material is best for the purpose. I want to use something that will wear well and stand the expansion and contraction without leaking. Would copper be better than zinc or galvanized iron?

Note.—It is probable that tinned copper will be the best, both for durability and cleanliness. The tank lining can be made outside of the tank and then put in. It should have a wire at the top, or a wood frame could be used, with the edge of the copper turned over and fastened to it with nails. We would be glad to have other suggestions from our readers.



Rimmed Covers for Coffee Pots.

From J. G. F. W., *Indiana.*—I have lately found that we can buy rimmed covers for almost the same price as plain ones, and by changing the patterns of coffee pots and boilers we reduce the cost by cutting off about one-third of the work. If our brother tinners would do likewise they would be better able to compete with factory ware.

THE RETAIL STORE.

The Eclipse Gas Stove.

A new gas stove is herewith illustrated which has been brought out by the Eclipse Gas Stove Company, successor to the Van Wie Gas Stove Works of Rockford, Ill. This style of stove is made in two sizes, the larger with ovens 18 x 18 x 11 inches and top 23 x 27 inches, while the smaller has ovens 14½ x 14 x 10 inches and top 23 x 23 inches. The end shelf on each is 6 x 23 inches. They have a smooth open top, and the grates come flush with the top. Each size is made with three or four cooking holes, and a very neat water heater can be attached to any of the four different stoves, thus making eight styles. An important feature is that any three-burner stove can be changed to a four-burner after the stove is set up and connected. This change can be made without disconnecting or in any way disturbing the stove, so that consumers can increase the capacity of their stoves, and are not obliged to sell a good stove at a sacrifice when they desire a larger one. Linings will be put in with brass screws, so that the pieces can be easily taken out when repairing is necessary. The advantage of having no "rusting in" of screws is appreciated by those who have to repair gas stoves. The company's Standard mixer will be used on the top burners and also on ovens. The design of the stove has been copyrighted, it being entirely original, and the cut here presented is an excellent reproduction.

The Eclipse Gas Stove.

Covert Snaps.

Covert Mfg. Company, West Troy, N. Y., are introducing two new snaps, the Trojan and Jockey, as herewith shown. The Trojan snap is of the bolt variety, and is so constructed, it is stated, as to possess features of great merit. These are made with a loop, as shown, also with a round eye. The Jockey snap has a steel spring, and is particularly noticeable for its neatness of design and utility. This snap is also made with a round eye. Both snaps are made with ⅝ inch to 2-inch loops, and with ½ inch to ⅞ inch round eyes.

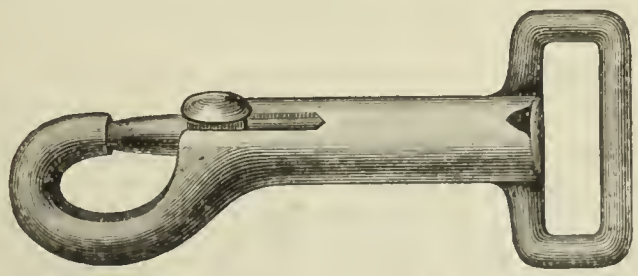


Fig. 1.—The Trojan Snap.

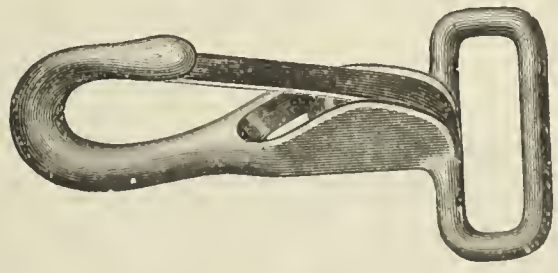

Fig. 2.—The Jockey Snap.

MEMORANDA.

THE FIRM of H. A. Tanner & Son, Aurora, Ill., have been succeeded by Henry R. Tanner.

J. R. RICH & SON, stoves and tinware, were recently burned out at Asheville, N. C. They were well insured and will continue in business.

THOMAS POLK of Jackson, Tenn., is reported as having sold his stoves, tinware and hardware business to Lawson, White & Co.

THE SHIRK REFRIGERATOR COMPANY, 273 Wabash avenue, Chicago, have opened branch offices at 30 Warren street, New York, and 905 Market street, Philadelphia. They have brought out some new features in refrigerators this season, which they believe will be appreciated by the trade.

JAMES A. NICHOLSON & Co., 116 South Calvert street, Baltimore, Md., as agent for H. S. Brewington, is offering two malleable iron household articles, one of which combines a stove lifter, ice pick, tack hammer and drawer, pan, kettle and pot lifter, screw driver and can opener. This article is furnished coppered and tinned, and measures 9½ inches in length. The other device measures 11 inches in length and combines ice pick, ice shaver and crusher, beef steak chopper and cutter, and is furnished coppered.

W. L. GOODRICH has severed his connection with the Chicago Stamping Company and now represents Sidney Shepard & Co. of Buffalo in Southern Michigan and Northern Indiana. Mr. Goodrich is a veteran in the Tinware trade. Prior to his engagement by the Chicago Stamping Company he spent a number of years with C. Sidney Shepard & Co. of Chicago. Few men are better known throughout the Western Hardware trade.

MATTISON, STEWART & Co. have taken store room and office accommodations at 69 Beekman street, New York, for the purpose of jobbing Hardware, House Furnishing Goods, Culinary Utensils and such desirable novelties or specialties as are being brought by manufacturers to their notice. They are business men of experience, fully acquainted with the trade, and have found it advisable to enlarge their business. They are traveling New England territory and portions of Pennsylvania, Ohio and Indiana, besides the metropolitan district in and about New York. They will include Garden Sets and Hose among other goods handled by them for some time.

STEAM AND HOT WATER.

Combination Heating.—IV.

BY J. W. HUGHES.

When a neat job was wished for and wall coils were used, they were screened by specially made base screens, as shown in Fig. 13. When set against the wall it was customary to first line the wall with a thickness of building paper, A. On this was placed a lining of sheet tin, B, the coils C setting close to but not touching the tin, a sufficient space being left for circulation of air around the pipes. Fig. 14 shows box coil, which could be fitted with the usual screen and marble top. In very small apartments, where every inch of room was of importance, the base coils or circulations were frequently let into the partition, as in Fig. 15, the tin and paper being fitted behind the coil, and the screen taking the place of the usual baseboard. Fig. 16 shows the wall coil or circulation commonly used, the return pipe being at either end, and each coil being fitted with air cock and spout for convenience of drawing off water. Figs. 17 and 18 show long circulation coils set with a pitch or fall. These coils give excellent results in all kinds of hot water heating, and are particularly adapted to apartments where space and appearance are not great objects. They are less liable to become air bound than the one illustrated in Fig. 16, which must at all times be set perfectly level.

Fig. 19 shows plan of a set of coils fitted up in the writer's house as an experiment. They have been working perfectly for the past 15 years. The main F is 1 inch and is not reduced in size, but is carried from one coil to another, dipping down under floors substantially as shown by the arrows. Great care was taken to prevent the formation of air pockets in any of the pipes under the floors. The coils, however, are not all in a row as shown, but are scattered about over a flat and are five in number. While not a desirable plan, "it do move" and has continued to do so for many years. Fig. 20 shows another plan, the pipes all being 1 inch. The water circulates in the direction of the arrows from C through A into coil F. Then by main F′ up and through coil G; from thence through riser H into header coil I and from top of one of the headers is taken the expansion tank. From one end of header coil the return J conveys the water into coil K, which winds around the partition, forming a coil to heat a room on each side, and from this through Z and coil M it returns to furnace through N, the arrangement of air cocks, feed, &c., being substantially as shown in the other plans. An arrangement of the kind shown in Fig. 20 calls for a powerful heater, and the circulation will, of necessity, be rapid. The objection to this plan is that coils M and K, &c., will not be as warm as F and G, &c., but by arranging to get the hotter coils in the colder or more exposed rooms this objection is not serious.

From what has been written the reader will be enabled to grasp the general principles and adapt them to his needs, and this is all that can be expected in any article on such a subject. It will be noticed that most of my allusions have been made to com-

bination hot water heating in the past tense. This is because it is really a form of heating seldom used now in the city where this article is written (Montreal, Canada). The straight hot lower portion of the feed chamber was cut off, and in its place fitted a close spiral coil of ¾ pipe. From this main and return pipes were run to an upper story, where they supplied sufficient heat to successfully warm a lean-to conservatory 15 feet long and 10 feet wide by 9 feet at the highest point, giving excellent satisfaction to the amateur botanist who owned it. A good idea of this plant can be obtained from Fig. 21, were taken off, as shown, one going to supply hot water reservoir I, the other a radiator, H, situated on floor above. By manipulating the valve on radiator when hot water is wanted in great quantity in I, it can be obtained; at other times each gets its equal share. Sometimes trouble was experienced in getting the circulation from the heater coil in the furnace to work the right way—that is, it would "back up," and

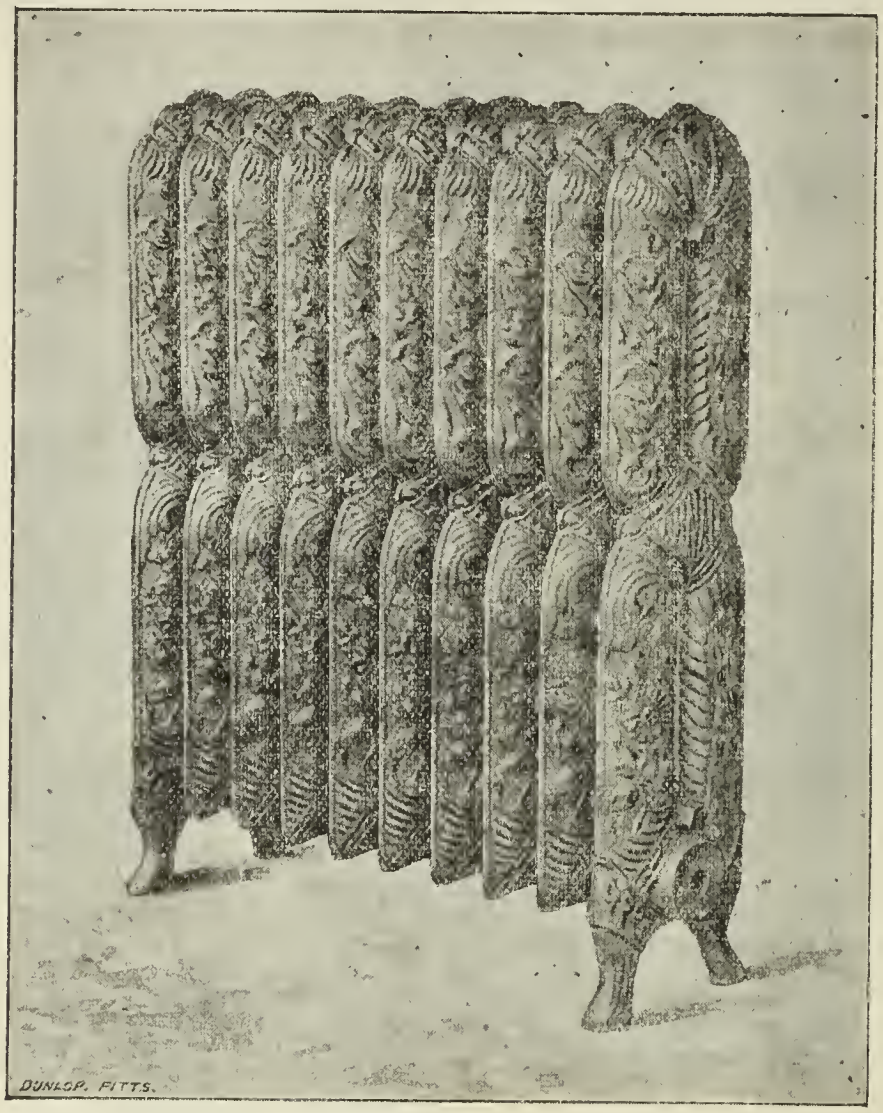
COMBINATION HEATING.



water apparatus has almost driven every other form of heating for domestic purposes from the field, but there is a good deal to be said in favor of the combination system, and it is undoubtedly worthy of the serious consideration of hot air furnacemen.

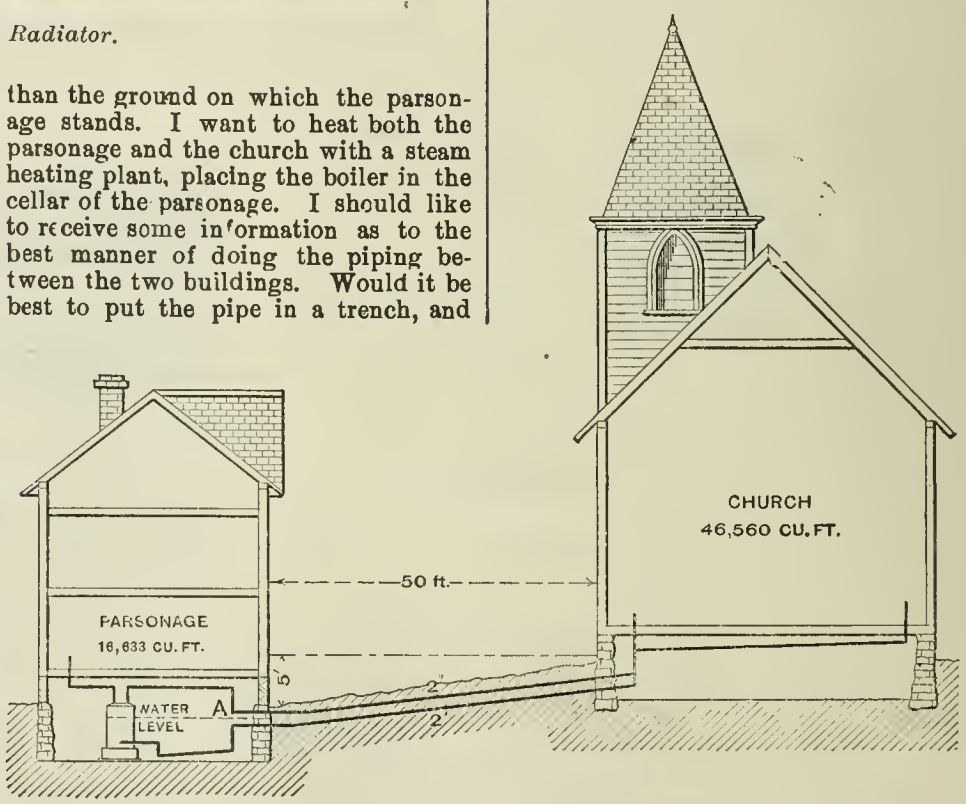
The principle has been applied in heating a small conservatory from an ordinary self-feeder hall stove. The A being fire pot; B coil replacing portion of feeder; C cut-off to receive coil.

Single coils and radiators to warm a room heated from the ordinary water back of a stove or range are common enough. One such recently fitted is shown in Fig. 22—A, range; B, 1-inch flow pipe from the heater; C, return; D, D, two 1 x ¾ inch Ys; ¾ inch branches fitted with bends (not elbows) the flow would be through the return pipe. A number of plans were tried to overcome this, the best being to make a dip or inverted siphon in the return pipe before it entered the furnace.

In filling the apparatus it is best to have all the air cocks open and fill very slowly. Cocks were specially made for this purpose, having only a ⅛-inch hole in the plug. As soon as

water began to run from air cocks they were closed uniil the apparatus was full, then reopened and a gallon or two of water drawn from each cock, or until such time as the water issuing showed no signs of containing air. When a coil refused to circulate, it was found an excellent plan to loosen the straps by which it was secured to wall, opening the air cock and letting water run into a large vessel, at the same time tilting the coil first up at one end, then at the other, until any air that had become jammed in the coil had escaped, which it would do in puffs. Of course, with coils having a pitch this kind of trouble did not occur. It is astonishing how little air will completely stop circulation. Fire slowly at first after coils are once started and there will be no more trouble.

The Ornate Radiator.



The Ornate Radiator.

The illustration presented herewith shows a new style of the Ornate radiator just put on the market by the United States Radiator Company, Saltsburg, Pa. The radiator shown represents the style in which the 32 inch hight is made. The central connection of the loops or columns has proven of advantage in hot water systems by securing a circulation of water when the radiator is not full. A feature of the ornamentation is the introduction of their trade-mark, bearing the word "Ornate" in the design.

WIRETON HEATING COMPANY have been incorporated at Chicago, with a capital stock of $50,000, for the purpose of manufacturing ventilating apparatus. The incorporators are Charles Loughbridge, David Williams, Allen L Fowler.

Problem for an Engineer.

From P. F., *Washington, N. J.*—There is a small church here containing about 46,550 cubic feet of space and a brick parsonage containing 16,663 cubic feet of space, located about 50 feet apart. The ground on which the church stands is about 5 feet higher than the ground on which the parsonage stands. I want to heat both the parsonage and the church with a steam heating plant, placing the boiler in the cellar of the parsonage. I should like to receive some information as to the best manner of doing the piping between the two buildings. Would it be best to put the pipe in a trench, and what size should the pipe be? I inclose a rough sketch of what I propose to do and would be pleased to have the subject criticised.

Problem for an Engineer.

Note.—A short time since we described the method of protecting a pipe that was run about 3 feet below the surface of the ground by a steam fitter in Springfield, Mass. A cast iron soil pipe was laid in perfect alignment between one residence and another and the joints carefully calked. This pipe was wrapped with asbestos paper to prevent the next wrapping of hair felt from overheating. The hair felt was then covered with oil paper and the trench filled in with cement around the pipe. In running the steam pipe it was suspended so that it did not come in contact with the sides of the cast iron pipe. A less expensive plan would be to use a wooden box around the pipe after it had been well wrapped. The size of the pipe will depend entirely on the amount of radiation that is to be placed in the church, and without more information than is given with the sketch it will be impossible to state what size would be best. The information that would be gained from consultation with a competent heating and ventilating engineer on this subject would be worth far more than the fee that would be charged. It would be necessary, however, to submit plans of both buildings that are to be heated to secure the best advice. Rules for computing radiation that have been tested are given in the "Essays on House Heating" taken from *The Metal Worker*.

A Pipe Fitting Question.

From W. H. P., *Washington, D. C.*—From the pipe fitting question in *The Metal Worker* of February 9 I would infer that several pipes are to be taken from the main pipe, if the sketch is correct. The explanation of the sketch would imply that only one outlet is to be used, but whichever is the correct solution the "bull head tee" would be preferable to a twin L or a Y, while either would be preferable for the return side. I find it more essential to secure an unobstructed return than some fitters think necessary. As many flow pipes may be taken from the main as desired.

The Nichols Tap and Reamer Wrench.

The cuts shown herewith represent a tap and reamer wrench, put on the market by the J. M. Carpenter Tap & Die Company, Pawtucket, R. I. In Fig. 2 the knurled sleeve is broken away, showing a right hand thread on the outside of the neck of the stock and a left hand thread on the handle. It is explained that the two threads are embraced by the corresponding interior threads of the sleeve; that a right hand turn of the sleeve closes the jaws while a left hand turn opens them, and that the handle moves in and out without any rotary motion, avoiding all tendency to unscrew while at work. The point is made that the large diameters on which the threads are enabled to be cut by this design allow the use of threads coarse enough to produce quick movements of the jaw, while the angle of the threads is so small that sufficient power is obtained by the hand alone so get a strong enough grip to prevent all loosening while at work. It is stated that no pin, wire, or other implement is needed to tighten its jaws upon the tap or reamer, the hand being sufficient to tighten the jaws; that the weakest point in similar wrenches is in this one greatly strengthened by the knurled sleeve, and that the wrench is of the best workmanship throughout, having hardened steel jaws and all parts interchangeable. The tool is made in five sizes, taking taps from 0 to 1¼ inches in diameter.

Fig. 1.—The Nichols Tap and Reamer Wrench.

Fig. 2.—Showing Working Parts of the Wrench.

Tests of Non-Conducting Pipe Coverings.

A series of tests have been made at the St. Louis Water Works by John A. Laird, to select the most suitable covering for pipes, boiler shells, &c., in the new pumping station at the Chain of Rocks. The report appears in the "Proceedings" of the Association of Engineering Societies. There were purchased asbestos sponge molded sectional covering, asbestos fire felt sectional covering and magnesia sectional covering, all for 1-inch pipe. Also, asbestos sponge cement felting, asbestos cement felting, plastic magnesia and fossil meal. Tests were also made on plaster of paris and sawdust, molded into covering for 1 inch pipe.

The different coverings were subjected to chemical examination by Mr. Wixford, chemist of the water works, with the following approximate results:

Asbestos Sponge, Molded.

Plaster of paris	95.8
Fibrous asbestos	4.2

Asbestos Fire Felt.

Asbestos	82
Carbonaceous matter not determined	18
Magnesia (Sectional).	
Magnesia	92.2
Fibrous asbestos	7.8
Magnesia (Plastic).	
Magnesium carbonate	93
Fibrous asbestos	7
Asbestos Cement Felting.	
(Probably) Powdered limestone	64.5
Plaster of paris	3.5
Asbestos	32
Asbestos Sponge Cement Felting.	
(Probably) Powdered limestone	59
Plaster of paris	10
Asbestos	31
Fossil Meal.	
Insoluble silicate	80
Carbonaceous matter, hair, paper, sawdust, &c	12
Soluble mineral matter	8

On all condensation tests the gauge pressure was held at 25 pounds. The water was drawn off every 15 minutes and was measured in cubic centimeters. Each test was continued for four hours. The mean results are tabulated below.

Condensation Tests.

Name of covering.	Ccm. Condensed per hour.
Magnesia (plastic)	334
Magnesia (sectional)	335.3
Asbestos fire felt	347.5
Asbestos sponge, molded	371.3
Fossil meal	376.2
Plaster of paris and sawdust	438
Asbestos fire felt cement	563.7
Asbestos sponge cement	604
Bare pipe	1085

On the question of durability Mr. Laird states that the magnesia sectional covering which has been on pipe at Bissell's Point for four years shows no signs of deterioration; also that the asbestos sponge molded covering which has been on pipes at Harlem Creek for less than two years is becoming soft, and the plaster of paris seems to be reduced back to the original powder, with nothing but the fibrous asbestos to hold it together. Another question is that of steam pressure. The experiments were made at the High Service Station, No. 2, and it was found convenient to have all tests made at 25 pounds gauge pressure. As the working pressure at Chain of Rocks will be at least 125 pounds, the relative efficiency of insulation will be slightly changed, but in Mr. Laird's opinion, not enough to change the conclusions here arrived at.

HEATING NOTES.

WALDRON MOORE, formerly connected with Eaton, Cole & Burnham Company, and now assistant manager of the New York branch of the Crane Company of Chicago, has recently paid the New England trade a visit.

THE BOILER used in heating the Baptist Church at Essex, Conn., has been ruined in a peculiar manner. During the recent cold snap the main pipe of the boiler was allowed to freeze. The water got out of the boiler, and the sexton of the church, not knowing of the condition of the boiler, started a fire. Then he went away to attend to some other duties, and when he returned the boiler was rendered useless.

THE J. H. MCLAIN COMPANY of Canton, Ohio, and 58 Dearborn street, Chicago, have issued a very handsome and artistic calendar, which runs from this month until March, 1896 It is a reproduction of a water color drawing by the well known artist Archie Gunn, and was made especially for the J. H. McLain Company. Mr. Gunn calls it "An American Girl Up to Date." It is a highly ornamental souvenir.

W. W. WARD will now talk the Royal line of heating apparatus, having been engaged by Manager Mackay of the New York house of Hart & Crouse, Utica, N. Y.

THE MODEL HEATING COMPANY, Philadelphia, are sending a postal card to the trade requesting them to "Wait a moment" before buying steam and hot water boilers until their 1895 catalogue is issued.

THE second of the series of lectures on steam and hot water heating presented under the auspices of the Chicago Steam Fitters' Protective Association will be given at Jefferson Hall, 70 Adams street, Monday evening, March 18. The subjects treated on will be combination heating, steam and hot water, steam heating as applied to large plants.

HARRIE D. CRANE of Cincinnati, Ohio, president of the National Association of Steam and Hot Water Fitters of the United States, attended the plumbers' convention at Columbus, Ohio, last week, and P. G. Munroe of New York, clerk of the association, attended the plumbers' convention, at Troy this week.

H. C. HODGES, president of the Detroit Lubricator Company, was in New York last week and left some samples of their new steam valves with W. A. Russell, their New York representative at 89 Centre street. The new valves are attractive in symmetry, having the circular appearance of the globe valve. The quick opening steam valve is ground flat and polished, with a monogram on three sides to distinguish it from the regular steam valve.

R. D. JACKSON, 89 Centre street, New York, is showing new cuts of the Electric steam and hot water boilers, which have had some slight changes made in the construction.

CHAS. F. HAUSS is assisted by J. W. Fryer in looking after the interests of

the Richmond Stove Company, New York. Mr. Hauss has an office in the showroom of Albert Cryer & Co., at 89 Centre street, where the Richmond Sectional and the Victor steam and hot water heaters are exhibited.

THE Association of House Heating Boiler Manufacturers had a meeting in New York on Thursday.

W. H. PFAHLER of the Abram Cox Stove Company, Philadelphia, made a visit to the heating trade on Centre street, New York, last week.

W. A. RUSSELL, 89 Centre street, New York, will represent the Model Heating Company, Philadelphia, in a large scope of territory. Mr. Russell says the Novelty line of steam and hot water boilers represents eight styles and 101 sizes with capacities for carrying from 100 to 3700 square feet of radiation.

A NUMBER of the delegates to the convention of the State Plumbers' Association at Columbus, Ohio, last week formed an organization to be an auxiliary to the National Association of Master Steam and Hot Water Fitters of the United States: President H D. Crane of Cincinnati was present and explained the objects of the association. The following officers were chosen: President, Charles Klie of Columbus; vice-president, W. D. Theobald, Canton; secretary, Frank Stratton, Columbus; treasurer, G. L. Saunners, Columbus; Executive Committee, John McVey, Lima; Herman Apple, Sandusky; Frank Love, Cincinnati; J. L Walker, Hamilton; G. W. Morgan, Cleveland, and J. V. Kraus, Akron. The newly formed association adjourned to meet next February in Cincinnati.

FRED. P. SMITH, consulting heating and ventilating engineer, Mohawk Building, 160 Fifth avenue, New York, has made the plans and is supervising the heating and ventilation of the new Proctor Theater on Fifty-eighth street, New York. Mr. Smith has the plans for similar work for several other large buildings and schools on the boards in his drafting room.

THE FIRM of Englehart & Krebs, 82 West Washington street, Chicago, have been dissolved, and a new company formed in their place, to be known as the Englehart & Stott Company. The officers of the new company are as follows: F. J. Englehart, president; D. M. Stott, formerly with the American Boiler Company, vice-president and treasurer; E. A. Smith, secretary. The company will retain their present location and do a general business in warm air, steam and hot water heating.

THE CARTON FURNACE COMPANY, Utica, N. Y., are about to issue a new catalogue showing a line of steam and hot water boilers. These boilers have been under test in residences before placing them on the market, and the catalogue is an evidence that the test has been satisfactory.

BEING desirous of increasing the sale of their product in Philadelphia and vicinity, the American Radiator Company have secured a commodious office and sample room at 506 Arch street, Philadelphia. The quarters are now being fitted up, and will be ready for occupancy by April 1. This branch will be under the supervision of the New York branch of the American Radiator Company, and the local manager will be Frank A. Brastow.

THE CALORIC CLUB, composed of manufacturers of house heating apparatus, had one of their enjoyable dinners on Wednesday evening at the Hotel Netherlands, New York.

New York State Steam Fitters.

Many of the delegates to the convention of plumbers at Troy, N. Y., remained to attend the meeting on Thursday to consider the proposition to form a State association of the Master Steam and Hot Water Fitters' Association. The meeting was held in the rooms 34 and 35, Hall Building. Representatives to the number of about 50 from all over the State attended. Among those in attendance were State Vice President F. A. Wells of New York, Past President Enoch Rutzler of New York, Secretary P. G. Monroe of New York and Jamas Curran and J. L. Wells, both of New York, of the National Executive Committee.

It was decided to form a State association. The organization was effected by electing the following · President, William M. Tobin; vice-president, John Creelman of Rochester; secretary, William F. Quinn of Troy; treasurer, P. C. Dougherty of Poughkeepsie; sergeant-at-arms, Charles Wills; Executive Committee, H. Patterson of Albany, James Conway of Jamestown, and T. L. Cusick of Kingston. The association will apply to the national association for admittance into that organization.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

BARRY & FELLOWS will erect at Forty-seventh street and Woodlawn avenue, Chicago, two $15,000 residences which will be heated by hot water.

E. W. PECK & Co., Derby, Conn., have a gang of plumbers and roofers at Seymour working on Dr. Benedict's new residence.

A COMMITTEE consisting of W. F. Nichols, H. E. McElwain and J. D. Hardy has been appointed by the Second Congregational Church Society of Holyoke, Mass., to look up a system of ventilation for the church and report at the next annual meeting.

JOHN M. PAGE & Co., Naugatuck, Conn., have received the contracts for heating and plumbing the new residences of L M. Tolles, George Craig, S. Gladding, Jr., and Geo. Merrill on Beecher Heights. The Victor hot water heater will be used.

SEALED PROPOSALS will be received by Chas. H. Jones, Toledo, Ohio, Auditor for Lucas County, up to 12 o'clock noon March 12, 1895, for the constructing and supplying of a steam heating, ventilation, power and hydraulic plant for the new Lucas County Court House. General plans and specifications prepared by David L. Stine, architect, are on file in the office of the Auditor of Lucas County, Ohio, and are to be considered a part of the invitation for bids.

THE LORD & BURNHAM COMPANY, Mohawk Building, 160 Fifth avenue, New York, are erecting greenhouses and installing the hot water heating plants, using their boilers, for Dr. Lucien Warner, Irvington, N. Y., R. B. Crane, Westfield, Mass., and H. A. Holcomb, New Bedford, Mass. They also have two notable contracts, one for a large conservatory for George Vanderbilt, at Biltmore, N. C., in which large horizontal tubular boilers will be used, the other for the New York Institute for the Instruction of the Deaf and Dumb, where floriculture and kitchen gardening will be taught the mutes. In this plant a National feed water heater is used for heating the water used in the radiation, steam for the heater being carried several hundred feet from the battery of boilers in use in the institution.

L. E. TURNER, Baldwinsville, Mass., is putting a Winchester steam heater in the residence of John Chisholm.

THOMAS J. O'MALLEY, 317 Wells street, Chicago, has the contract for the plumbing and drainage in the flat building of T. Sweeney, 1033 Sheffield avenue.

GEORGE FRANKLIN, 1343 West Ravenswood Park, Chicago, is to do the plumbing and drainage in the store building of W. J. Sanford, 1272 East Ravenswood Park.

WILLIAM BOWDEN, 238 Twenty-fifth street, Chicago, is to do the plumbing and drainage in the store and flat building of Frank Goedecke, 5008 and 5010 Cottage Grove avenue.

SMITH & DORNEY, 1046 North Western avenue, Chicago, have the contract for the plumbing and drainage in the flat building of J. L. Hawser, Richmond, near Chicago avenue.

THE HEATING of the birthplace of liberty, as Independence Hall, Philadelphia, is generally known, is to be changed. A modern steam heating plant is to be installed by the Model Heating Company, Philadelphia, who will use two of their double Novelty boilers and the Italian flue radiators of the American Radiator Company, New York.

LAWRENCE GRADY, New Haven, Conn., has the contract for the plumbing in Julia L. Gallagher's two-family house.

JOHN A. DODD, Middletown, Conn., is to erect a residence which will have a plumbing system and a hot water heating plant.

JOHN E. DARROW, New London, Conn., is to erect a fine residence in which the Hopson & Chapin Mfg. Company will install a hot water heating plant.

J. J. SULLIVAN, New Haven, Conn., has the plumbing contract for the new house of John Spargo.

E A. LETTNEY, West Haven, Conn., has the contract for the plumbing of the new house which C. E Humphrey is building on Water street, also one on Main street which W. H. Lettney is building.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until March 28, for work including the plumbing in the basement and first story of the United States Post Office Building at Aurora, Ill. Drawings and specifications may be had from the Supervising Architect at Washington or from the Superintendent at Aurora, Ill.

THE UNION FURNACE COMPANY, 65 Dearborn avenue, Chicago, are to install a combination heating system in the flat building of S. F. Whitehouse, 3957 and 3959 Ellis avenue.

ROOFING AND CORNICE.

Conductor Heads.—III.

BY CORNICE WORKER.

Patterns for an Octagonal Leader Head.

In Fig. 21 are shown the elevation, plan and patterns of an octagonal leader head. A B C D represents the front elevation, corresponding to E G H I J F of the plan, C D O of the elevation corresponding to the plan of the octagon leader shown by L M N O P R S obtained on the miter line N J draw lines parallel to J I cutting the miter line I O; likewise from the intersections on the miter line I O draw lines parallel to I H intersecting the miter line H P. As the front of the head D′ in plan is the same as E′ and C′, it will only be necessary to obtain the pattern for the front D′, which can be used for E′ and C′. As the side of the head A′ in plan is the same as the opposite side B′, it will only be necessary to obtain the pattern for A′, which can be used

For the pattern of the front proceed as follows: At right angles to H I of the plan draw the stretchcut line T U, as shown, upon which place the stretchout of the profile B D of the elevation, as shown by the small figures. At right angles to T U, and through the small figures, draw lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn at right angles to H I from the intersections on the miter lines H P and O I. Lines traced through these intersections, as

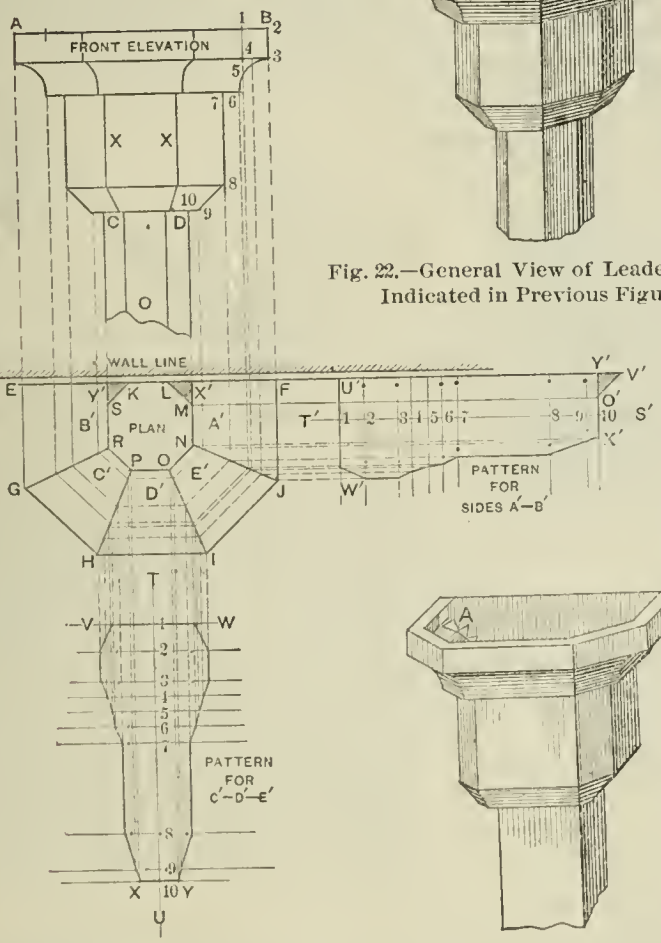


Fig. 21.—Elevation, Plan and Patterns for an Octagonal Leader Head.

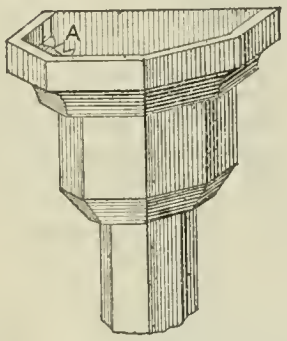

Fig. 22.—General View of Leader Head Indicated in Previous Figure.

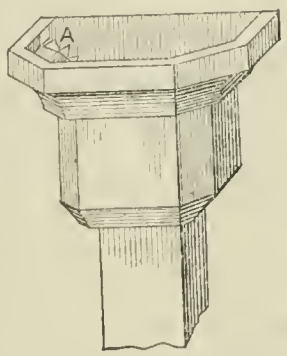

Fig. 24.—General View of Leader Head Indicated in Previous Figure.

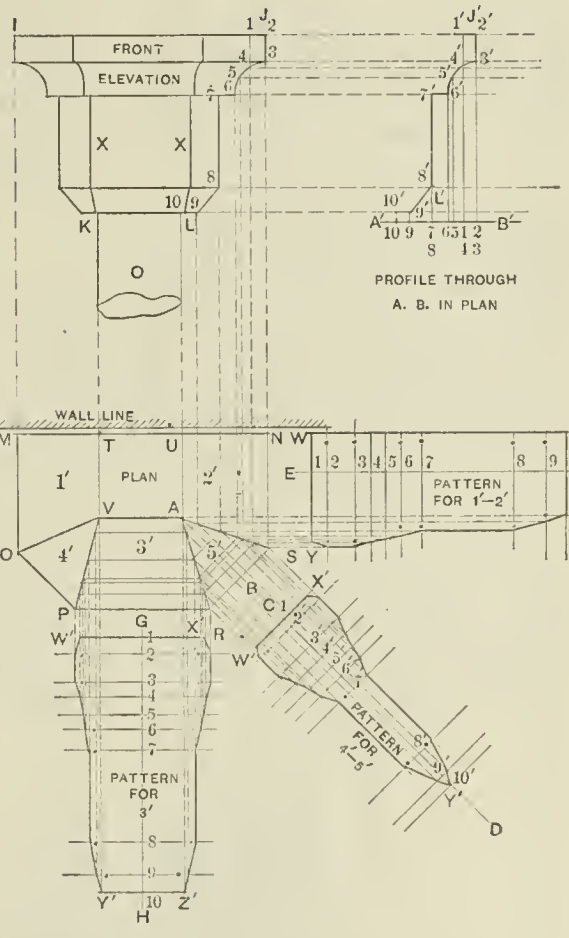

Fig. 23.—Elevation, Plan and Patterns for an Octagon Head Connecting with a Square Leader.

CONDUCTOR HEADS.—III.—PATTERNS FOR OCTAGONAL HEADS.

K. The dotted lines drawn from the plan to the elevation show their relation to each other. The two miter lines shown in elevation by X X are not necessary in the developement of the pattern. After the plans of the leader and head have been properly drawn, as shown in Fig. 21, connect the corners of the leader to the corners of the head by miter lines, as indicated by N J, I O, P H and G R. For the several patterns proceed as follows: Divide the curved portion of the profile B D of the front elevation into an equal number of parts, as indicated by the small figures.

From these, and at right angles to A B of the elevation, draw lines through the plan view cutting the miter line N J, as shown. From the intersections for B′, reversing it in forming. For the pattern for the side of the head shown by A′ in plan, draw a line at right angles to F J, as shown by T′ S′, upon which place the stretchcut of the profile B D of the front elevation, as shown by the small figures on the line T′ S′.

At right angles to T′ S′, and through the small figures, draw the usual measuring lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn at right angles to F J from the intersections on the miter line J N. Now trace a line through the intersections as shown from W′ to X′. At right angles to F J extend the line E F of the plan indefinitely on to the pattern, as shown by the line U′ Y′. Then will W′ X′ Y′ U′ be the pattern required for the sides A′ and B′ in plan.

shown by V X and W Y, will be the required pattern for the sides E′, D′ and C′ of the plan.

In practice it would only be necessary to obtain the pattern for the side A′ in plan, because the angles J I H G are alike, thus making the miter cuts on all of the patterns the same. The following will illustrate how the front pattern is obtained by using the side pattern. Let W′ X′ Y′ U′ represent the pattern for the side A′, and let V W in the pattern of the front represent a straight line drawn on a sheet of metal. Now take the pattern of the side, and place W′ U′ upon the line V W on the metal and mark the miter cut V X. Now take the distance P O of the plan in the dividers, and place it as shown by X Y in the pattern. Now reverse

the pattern of the side and place the edge U′ W′ upon the line V W on the sheet of metal, making the corner X′ in the pattern of the side meet the corner Y previously obtained with the dividers, and draw the miter cut W Y, which completes the pattern. For the pattern for the flat piece forming the back, shown by E F, Fig. 21, place a sheet of metal of the required size under the front elevation and prick through with a scribe awl as much as is indicated by A B D C. If the leader head was put together and the octagon pipe joined to it there would be found two openings, indicated in the plan by the shaded lines X′ L M and K S Y′. To avoid this duplicate the triangle Y′ S K and place it on the pattern for sides. as indicated by the shaded lines Y′ V′ O′, which completes the entire set of patterns required for an octagonal leader head joining to an octagon leader. Fig. 22 shows a perspective view of the finished leader head, as seen from the front and top. A indicates the laps which are placed on the sides of the pattern and soldered water tight to the flat back.

Obtaining the patterns for a leader head forming the transition from a square leader to an octagon head :

In Fig. 23 are shown the elevation, plan and several patterns required to construct a leader head, forming a transition from a square leader to an octagon head. Let I J L K represent the front elevation, corresponding to M O P R S N of the plan, K L O of the elevation corresponding to the leader T U A V of the plan. The miter lines shown in the front elevation by X X are not necessary in the development of the patterns, but are only shown to give a front view of the article when finished. The dotted lines drawn from the elevation to the plan show their relationship to each other. After the plan of the leader and leader head have been properly drawn construct the miter lines in plan, as indicated by A S, A R, V P and V O. Now, divide the curved portion of the profile J L of the elevation into an equal number of parts, as shown by the small figures. From the small figures, and at right angles to I J of the elevation, draw lines through the plan view, intersecting the miter line A S, as shown. From the intersections obtained on the miter line A S draw lines parallel to S R, intersecting the miter line R A. Likewise from the intersections obtained on R A draw lines parallel to R P, intersecting the miter line V P, as shown. For the pattern for the side of the head shown by 2′ in plan, and which will also be the pattern for the side 1′, proceed as follows: At right angles to N S of the plan draw the line E F, as shown, upon which place the stretchout of the profile J L of the elevation, as indicated by the small figures on the stretchout line E F. At right angles to E F, and through the small figures, draw lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn at right angles to N S from the intersections on the miter line A S. Trace a line through these intersections, as shown by Y Z. Extend the line M N of the plan upon the pattern, as shown by W X. Then will W Y Z X be the pattern for the sides shown in plan by 1′ and 2′.

For the pattern of the front shown in plan by 3′ proceed as follows: At right angles to P R of the plan draw the line G H, upon which place the stretchout of the profile J L of the elevation, as shown by the small figures, and draw the usual measuring lines, which intersect with lines of corresponding numbers drawn from the intersections on the miter lines V P and R A, at right angles to P R. A line traced through these intersections, as shown by W′ and Z′ X′, will be the required pattern for the front of head shown in plan view by 3′. As the angles N S A, A R P and R P V are the same, it is self evident that the miter cut for each of the angles will be alike, and in practice the pattern for the front could be obtained by using the pattern for the side, in the same manner as has been explained in connection with Fig. 21. Before obtaining the pattern forming the transition from the square to the octagon it will be necessary to obtain a profile through A B in plan, for which proceed as follows: At right angles to R S of the plan draw the line A B, cutting the corner A of the leader, as shown. As the distance A B, or the distance at right angles to R S, is less than the distance U N, or the distance at right angles to S N, a profile will have to be obtained through the line A B from which to obtain the stretchout in developing the pattern. As the hight of all points in this piece is the same, draw lines parallel to I J of the elevation, through the small figures in the profile J L, producing them indefinitely as shown. Transfer the intersections obtained on the line A B in plan to any horizontal line beneath the profile, to be constructed as shown by A′ B′. From the points on A′ B′ erect vertical lines intersecting lines of corresponding number previously drawn, as shown from J′ to L′.

For the pattern of the transition piece shown in plan by 5′ proceed as follows: At right angles to R S of the plan draw the line C D, as shown, upon which transfer each separate space from the profile J′ L′ upon the line C D, as shown by the small figures 1′, 2′, 3′, &c. At right angles to C D, and through the small figures, draw lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn from the miter lines A R and S A at right angles to R S. Lines traced through these intersections, as shown by W′ Y′ and X′ Y′, will be the required pattern for the two transition pieces shown in plan view by 4′ and 5′. Laps can be allowed on the pattern for front and sides, thus avoiding laps on the transition pieces and on the flat back shown in plan by M N. For the pattern of the flat back indicated by M N in plan view, simply prick through the elevation I J L K, Fig. 23, direct upon the metal, which completes the entire patterns required. Fig. 24 shows a persective view of the leader head. The laps soldered against the back of the head are indicated at A.

The flanging of the square and octagon tubes as required is done upon the hatchet stake or by means of a flat plyers.

Forming the Head.

The same method is employed for forming the molding B D, shown in elevation in Fig. 21, as that described in connection with Fig. 20 in the last chapter. The bends 2 and 3 are made upon the hatchet stake and placed upon the former S, Fig. 20, in the position shown by X^1 A^2. Hold X^1 firmly against the former S and press down A^2. which will form the cove shown by X^1 B^2. The following sharp bends, shown in the profile B D in Fig. 21 by 6, 7, 8, 9 and 10, are made upon the hatchet stake by means of a mallet.

Soldering the Head Together.

After the heads have been accurately formed to their respective profiles the laps are bent off with flat pliers, square or octagon, according to the plan of the head. Cut a small octagon bevel from heavy sheet iron, to be used in tacking the parts together. Tack with solder the various parts, beginning with the front and ending with the back. Now look down over the members of the molding so as to see if they are accurately placed with regard to one another and that the head is not lopsided. Then solder water tight and put in the pipe last.

There is always a risk in using the bevel that it may be moved in some way or other, thereby changing the angle, and if not seen in time often causing the work which was done with the bevel to be taken apart. To avoid this, any old piece of metal can be placed under the angle required and pricked through upon the metal and cut out with the shears; the angle will then be stationary and no risk will be taken.

Folsom's New Model Roof Snow Guard.

In Fig. 1 of the accompanying cuts is shown a new model roof snow guard offered by the Folsom Snow Guard Company, 33 Lincoln street, Boston,

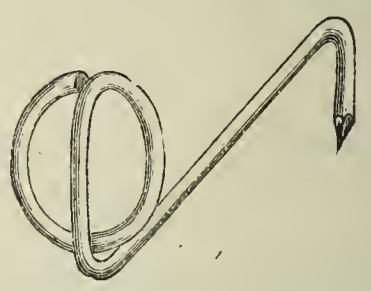

Fig. 1.—Folsom's New Model Roof Snow Guard.

Mass. The application of the guards is shown in Fig. 2, the point of the guard being driven in above each slate, the joints being left open for the shanks or body parts of the guards. The manufacturers recommend their use distributed over the whole area of a roof to obtain the best results, and state that each guard will protect 300 square inches on a ¼ pitch roof, 200 square inches on a ⅓ pitch roof, 100 square inches on a ½ pitch roof, and 50 square inches on a Gothic roof. It is remarked by the makers that where expense is a

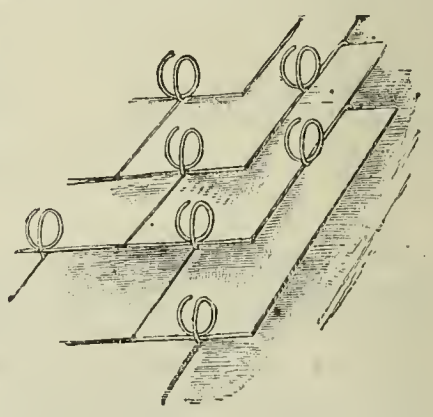

Fig. 2.—Application of Snow Guards.

consideration, or in sections where snow falls are light, five courses of slate at the eaves, with a guard in each joint, are more efficient than a guard rail, and at a fraction of the expense. The manufacturers state that the guards protect roofs by holding the snow immovable where it falls, and that the sun acting upon the large area exposed to its action while the heat of the roof acting upon the under side of the same area, allows

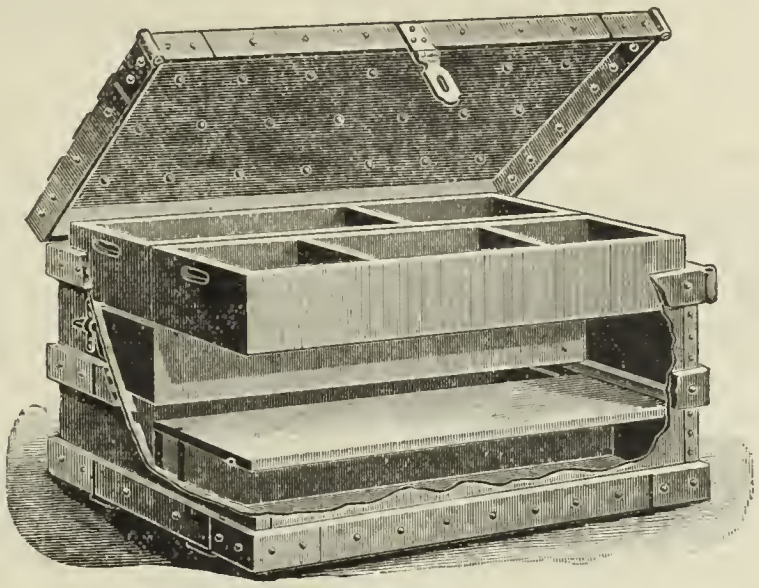
the snow to melt rapidly, leaving the roof clear. It is pointed out on the other hand that a guard rail holds the snow in a large drift on the eaves, where the heat acts slowly, so it alternately thaws and freezes, leaking through the roof and overhanging on the eaves.

FLASHINGS.

THE AMERICAN ROOFING COMPANY, St. Louis and Cincinnati, are running both of their plants at full turn. Their American metallic lathing is meeting with excellent success, and they have recently booked several large orders. They report an increase of over 50 per cent. in their business in the first two months of this year in comparison with last year, and state the present month gives indication of doing as well as the months of January and February.

THE E. E. SOUTHER IRON COMPANY, St. Louis, report an excellent demand for the various forms of corrugated iron which they manufacture. They report the receipt of orders for three carloads in one day's mail, two of which went to Texas, the other to a Northern point. They have recently added new machinery to their factory and have increased their facilities for manufacturing, so that they are enabled to make prompt shipments of either large or small orders.

THE CHATTANOOGA STEEL ROOFING COMPANY, Chattanooga, Tenn., have in process of preparation a new and enlarged edition of an illustrated catalogue, which will be mailed free to any one making application. We understand the volume will be ready for distribution about April 1 and will contain something like 200 illustrations of cornice work and metal roofing. The company are among the largest manufacturers of metal roofing and galvanized iron work in the country, and have a well equipped plant provided with modern improved machinery.



JOHN SEATON & Co., 78-80 Washington avenue, Brooklyn, N. Y., are busily engaged on a number of important jobs covering cornices, skylight and roofing work. They have the contract for the glass and copper work of the winter garden now being built at the North Carolina residence of George W. Vanderbilt, for which the glass to be used is ¾ inch plate and the metal work of the most elaborate nature. The firm are also putting up the skylights, copper cornices and tiling and slate roofs of the new St. Luke's Hospital, and have under way a similar contract for the new building of the American Surety Company at the corner of Broadway and Pine street and for the Presbyterian Mission Building, corner of Fifth avenue and Twentieth street, N. Y. City.

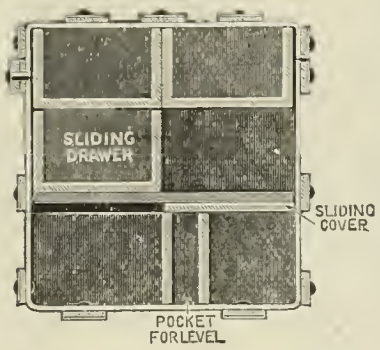
M. F. WESTERGREN, proprietor of the Architectural Sheet Metal Works, 205-207 East Ninety-ninth street, New York City, is busy just now on a number of important contracts. Among the work in hand may be mentioned the copper cornices and skylights of the new building of the University of the City of New York and the roofs and cornices of a number of school buildings throughout the city.

N. BOIS, proprietor of the Eagle Cornice & Skylight Works, 30 and 32 Sullivan street, New York City, has recently aassociated with him as partner M. Steinmetz, with a view to enlarging the business. We understand that Mr. Steinmetz comes from Boston, where he enjoys the reputation of being a practical mechanic in this line.

Vanderman's Steel Tool Chest.

The Vanderman Heating & Plumbing Company, Willimantic, Conn., are manufacturing a new form of their steel tool chest. The chest, illustrated in the accompanying cuts, is known as Style D and is, it will be noted, of different internal arrangement from the other chests which they have been making. The chests are made from $\frac{1}{16}$ inch cold rolled sheet steel with malleable corner pieces and hardwood braces and are fitted with heavy wrought iron hinges and hasps, the cover being so arranged as to be held open by support from the back of the chest. The chests are furnished with brass lock and bolts to screw down the cover at the front corners. They are described as lighter than a first class wood chest besides being much stronger. They are neatly finished so as to present an attractive appearance. Fig. 1 shows the chest with the side broken away, illustrating the arrangement of the compartments, while Fig. 2, which is a section through the chest, further illustrates the arrangement of the drawers and details. Style D is made in four sizes. No. 1 is 11 inches deep, 12 inches wide and 24 inches long, while No. 4 is 19 inches deep, 20 inches wide and 42 inches long, Nos. 2 and 3 being intermediate in size.

Vanderman's Steel Tool Chest.—Fig. 1.—Broken View of Style D.



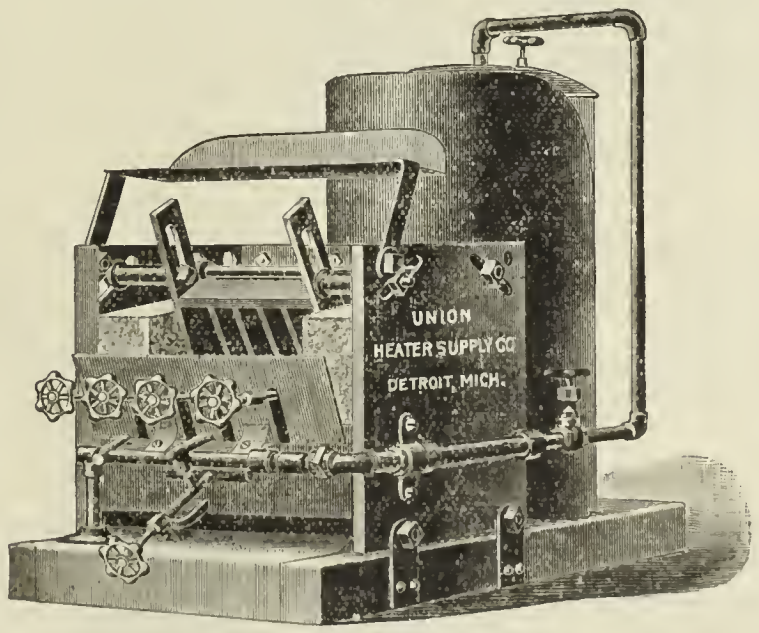


Fig. 2.—Sectional View through Style D.

Rivet Heater.

A very convenient apparatus is found by workmen in the rivet heater shown in the accompanying picture. It is made by the Union Heater Supply Company, 90 Congress street, Detroit, Mich., and gasoline is used for the fuel. It is designed for use by boiler makers and bridge contractors and is adapted for heating rivets for any character of work, taking the place of a blast forge. It occupies little space and the fuel is easily handled and a steady heat is continuously maintained. It is claimed that as fast as the heated rivets are removed from the hopper others drop down to take their place, and that the rivets are heated as fast as one man can drive them. Air pressure is applied to the fuel tank after it is filled, and then no further attention is required by the heater, which, without the dirt of coal, feeds the rivets hot and rapidly. The flow of gasoline is governed by a needle valve, and the burner is of a type that has proven successful and satisfactory. The convenience of the fuel and its low cost for the work accomplished are specially pointed out.

Rivet Heater.

TIN PLATES.

The Black Plate Mills.

John Jarrett of Pittsburgh, secretary of the Tinned Plate Manufacturers' Association of the United States, has recently sent out to the members of that organization and to others interested in the tin plate trade a letter concerning the number of black plate mills in the United States, with present and prospective production, and other matters pertaining to this important industry. The letter in full is as follows:

In accordance with the action taken at the semi-annual meeting of the Tinned Plate Manufacturers' Association the following exhibit is submitted, giving, as we can obtain at present, the number of black plate mills in the United States, present and prospective, the capacity and the American market for consumption of domestic tin plate, &c.:

Name of firm.	Location.	Mills completed and constructing.	Mills contemplated or prospective.
Somers Bros	Brooklyn, N. Y.	4	..
U. S. Iron & Tin Plate Company	Demmler, Pa.	7	..
Marshall Bros. & Co	Philadelphia, Pa.	5	..
Lalance & Grosjean	Harrisburg, Pa.	2	..
Blairsville Rolling Mill & Tin Plate Company	Blairsville, Pa	2	4
New Castle Steel & Tin Plate Company	New Castle, Pa.	16	..
Ellwood Tin Plate Company	Ellwood City, Pa.	4	..
Canonsburg Iron & Steel Company	Pittsburgh, Pa.	3	..
Monongahela Tin Plate Company	Pittsburgh, Pa.	9	7
Pittsburgh Tin Plate Company	New Kensington, Pa.	2	2
New Kensington Tin Plate Company	New Kensington, Pa.	6	..
Wallace, Banfield & Co	Irondale, Ohio.	4	..
Falcon Iron & Nail Company	Niles, Ohio	4	..
Ætna-Standard Iron & Steel Company	Bridgeport, Ohio	6	..
Britton Rolling Mill Company	Cleveland, Ohio	4	..
Beaver Tin Plate Company	New Lisbon, Ohio	4	..
Morton Tin Plate Company	Cambridge, Ohio	4	..
Reeves Iron Company	Canal Dover, Ohio	1	3
Laughlin & Junction	Martin's Ferry, Ohio	6	..
Crescent Sheet & Steel Company	Cleveland, Ohio	4	2
Whitaker Iron Company	Wheeling, W. Va.	2	..
La Belle Iron Works	Wheeling, W. Va.	4	..
Old Dominion Iron & Nail Works Company	Richmond, Va.	4	..
American Tin Plate Company	Elwood, Ind.	16	2
The Morewood Company	Gas City, Ind.	6	10
Irondale Iron & Steel Company	Middletown, Ind.	6	..
National Tin Plate Company	Anderson, Ind	4	2
Montpelier Tin Plate Company	Montpelier, Ind.	6	..
Atlanta Tin Plate Company	Atlanta, Ind.	3	..
St. Louis Stamping Company	St. Louis, Mo.	8	..
Cumberland Steel & Tin Plate Company	Cumberland, Md.	4	..
Baltimore Iron, Steel & Tin Plate Company	Baltimore, Md.	4	6
Illinois Steel Company	Chicago, Ill.	..	18
Great Western Tin Plate Company	Joliet Ill	2	2
Totals		166	58

	Boxes.
Capacity of 166 mills completed and in course of construction, at 30,000 boxes per mill per annum	4,980,000
58 prospective mills	1,740,000
Total	6,720,000
The consumption of tin plates in the United States per annum is about	6,000,000
Deduct supply for Pacific Coast, dressed meats and fish, and for Standard Oil Company, imported plates for export on which drawback is allowed, about	1,500,000
Net market for consumption of domestic plates	4,500,000

Operating the mills completed and in course of construction to their capacity would, therefore, give us an overproduction of 480,000 boxes per annum. Including the prospective mills the overproduction would reach 2,220,000 boxes, or 50 per cent. in excess of the net market for home consumption.

The tin plate clause of the McKinley bill went into effect on July 1, 1891. In less than a period of four years the American tin plate industry has so developed as to more than meet the requirements of the home market. Such growth is unparalleled. No other industry, even with the stimulus of the highest protective duties, has ever made such progress in the same period of time. The industry has now reached a point that calls for the closest investigation on the part of those who meditate going into the business of tin plate manufacture, and closer relationship and affiliation between those already in the business.

It may be interesting to all concerned to know that the tin plate works in England and Wales have an aggregate of 519 mills. Of this number 232 mills were idle during the year 1894. The outlook for the tin plate industry is not the most promising.

SCRAP.

A LATE CABLE DISPATCH from Wales intimates that labor troubles are feared in the tin plate districts. The associated manufacturers propose to insert a strike clause in all contracts.

IT IS REPORTED that the tinning plant of the Wheeling Corrugating Company, Wheeling, W. Va., which is ready for operation, will start into the business of coating tin plates for the market within a short period, procuring the necessary black plate from the Whitaker Iron Company's mills.

IN ORDER to be able to carry larger stocks of merchandise to meet the wants of an increasing business, Merchant & Co., Incorporated, now located at 247 Pearl street, have leased for a term of years the five-story building 245–247 Water street, having a frontage of 37 feet and good depth, where C. H. Bolles, Jr., the New York manager of Merchant & Co, Incorporated, will be pleased to meet on April 1 his many customers in New York and adjacent cities. The Brooklyn store of Merchant & Co., Incorporated, on Flushing avenue, will remain as before under the personal supervision of the New York office.

J. A. NEIL, president of the Montpelier Sheet & Tin Plate Company, report their works about completed and ready to go into operation about March 12. These works consist of four of Totten & Hogg's hot mills, also four of their cold mills. The tinning department will contain 11 stacks with capacity for tinning the entire product of the mills. These works, although located in Indiana, are virtually a Columbus, Ohio, enterprise, and it is there the general office is located. Harry Herbert, late superintendent of the New Castle Steel & Tin Plate Company, has charge of the works. Neil Fahrion & Co. of Columbus, Ohio, are the general agents of the compsny for the purchase of all material and sale of the products.

AN ITEM in the Pittsburgh *Times* records the fact that P. H. Laufman, the pioneer tin plate manufacturer of that city, celebrated the fifty-second anniversary of his joining the Methodist Church on March 3, by making an address in the Oakland Methodist Episcopal Church, in which he urged his hearers to be practical Christians. Commenting on this, the *Times* remarks: "It is probable that Mr. Laufman's employees to the last man would testify that he practices this precept. He was never known to hold out against the signing of the wage scale that any other manufacturer could work under, and he has frequently declared that he would rather not run his plant than do it by paying starvation wages. His plant at Apollo has often been running when many others were closed pending the settlement of disputes. His seems to be a case, too, where practical Christianity was profitable, as it is not of record that he was ever anything else than prosperous."

THE ANNOUNCEMENT IS MADE that the National Tin Plate Company will have their new plant, at Anderson, Ind., in full operation by May 1. Employment will be furnished to several hundred men.

THE WHITAKER IRON COMPANY, Wheeling, W. Va., have resumed work at their mills after a temporary idleness. Several of their sheet mills have been altered into tin mills and the company will shortly be putting out a good supply of black plate for tinning purposes.

A LETTER received from San Francisco, dated at the close of February, contains the following particulars in regard to the tin plate trade on the Pacific Coast: "There has been no great activity in tin plate, but the stock on hand has been very low and that has

exerted a favorable influence on prices. The Alaska salmon fleet is now being fitted out and demand is brisking up a bit. The result of these various influences, the light stock and the improved demand, has been to cause an advance to $4.75 to $5. Unless we pretty soon receive large invoices we may expect to see a further advance. We are now receiving some by rail, but at best this is an expensive method of transportation. The total imports since the opening of the year have been 34,258 boxes. The probabilities are that the pack of salmon and canned fruits will in 1895 be larger than ever. In 1894 there were 3,000,000 cases, 144,000,000 tins, of both packed. This required a good deal of tin plate."

THE AMERICAN TIN PLATE COMPANY'S Works, Elwood, Ind., are reported as turning out 6000 boxes of tin plate a week. The list of workmen has been nearly doubled recently. Nine mills are in operation.

THE MCLANAHAN & STONE FOUNDRY COMPANY have shipped one of their largest bar shears to the Atlanta Steel & Tin Plate Company, Atlanta, Ind.

WE HAVE BEEN WELL SUPPLIED with blotters by N. & G. Taylor Company, Philadelphia, who take this means of calling attention to several of their brands of tin plates. One relates to the Brilliant and Royal Bright; next to Taylor's Old Style roofing; next to Columbia terne. Then comes the Taylor roofing tin; another relates to four standard brands which they enumerate, while two larger blotters give some further information about their Old Style, the features of its manufacture being referred to.

THE WORKS of the Ashburnham Tin Plate Company, Burry Port, Wales, restarted on Tuesday after a prolonged shut down.

ACCORDING TO ENGLISH ADVICES there is some talk of a general stoppage of the Welsh tin plate mill throughout next month.

THE NEW CASTLE STEEL & TIN PLATE COMPANY have purchased 6 acres of land lying to the north of their mill. It is excellently adapted for manufacturing purposes, being near the railroads and affording plenty of room for additions to the mill and for the side tracks needed.

LAST WEEK ground was broken for the erection of the new tin plate plant of the Laughlin Iron Company at Martin's Ferry, Ohio. A full description of this new plant has already appeared in these columns. The Totten & Hogg Iron & Steel Foundry Company of Pittsburgh have the contract.

THE *British Iron and Coal Trades Review* states that a firm of tin plate manufacturers at Llanelly, South Wales, have under consideration an offer made by a Chinese firm for the supply of tin plates for nine months in each year for the next seven years. The order had not yet been booked by last advices, but the firm referred to expect to secure it. This might open up a new market for British plates.

PRESS DISPATCHES from Baltimore, Md., assert that three new tin plate works are to be put in operation in that city or its vicinity this year. The largest will, it is said, be started with Chicago capital, Norton Brothers, the well-known can makers of that city, being largely interested. The Stickney Iron Company of Baltimore are also credited with the intention of building a tin plate mill, to be operated in connection with their iron works at Canton. Orders for a 1000 horse-power Corliss engine and boilers for the new works have been placed with the Maryland Steel Company, at Sparrow's Point, Md. The third works will, it is rumored, be located at Curtis Bay, in conjunction with a rolling mill plant now being built there.

Trade Notes.

FOLLANSBEE BROTHERS COMPANY, successors to James B. Scott & Co., 122 and 124 Second avenue, Pittsburgh, Pa., in their advertisement elsewhere in this issue direct attention of the trade to their Scott's Extra Coated Guaranteed Roofing Tin Plate. The trade are requested to send for pamphlet giving description of this brand and *fac similes* of testimonials received from consumers. Attention is also directed to their Triumph Old Style, which is referred to as containing a little less coating than the above grade, but is a palm oil process Plate.

CARL H. ARWE, 1348 DeKalb avenue, Brooklyn, N. Y., issues an illustrated catalogue of supplies for the bar, wine and liquor trade which he manufactures. A variety of Bar Urns are illustrated and described, besides miscellaneous supplies. A price list accompanies the circular.

IT WILL BE SEEN by an announcement elsewhere in this issue that the Clifton Springs Mfg. Company, Clifton Springs, N. Y., are still in existence and ship large quantities of the Evans Patent Anti-Rusting Tinware. This well-known ware is distinguished by their trade-mark, which is a Greek cross.

THE ARTICLES OF INCORPORATION of the Hygeia Ventilating and Manufacturing Company have been filed at Quincy, Ill. The stock is $3000 and is held by George Bakewell, William Scharnweber and R. E. Tearse, $1000 each.

WE ARE GLAD TO KNOW that the Joseph Dixon Crucible Company, Jersey City, N. J., are to continue their practice of sending out monthly calendars on office blotters, the same as they did last year. They are serviceable reminders of the Dixon Pencil.

BATES & ANDERSON will operate a brass foundry in New Orleans, La.

IN THE COURTS at Pittsburgh last week Geo. S. Griscom, receiver of the Moorhead-McCleane Company of that city, filed an answer to the application of the New York Life Insurance Company for permission to foreclose a mortgage of $350,000 on the property of the company. Mr. Griscom states that in the present depressed condition of manufacturing interests if the New York Life Insurance Company are allowed to foreclose and sell the property it will be sacrificed and result in a total defeat of the hopes of the extension creditors in securing something on their notes.

A FEATURE in the Paint trade has been developed at Boonton, N. J., by the Atlantic Paint Works, who convert puddle furnace slag into a paint pigment, for which claims of superiority to the ordinary Oxide of Iron Paint are made, it being stated that it is much harder, absolutely non-corrosive, and is of greater covering capacity. It is asserted that the intense heat to which this slag is subjected in the furnace causes a complete union of metallic iron and silica, forming the gloss of iron, which for structural iron, bridges, metal roofing, boilers, ship bottoms, stacks and similar purposes proves a most desirable Paint. It is stated that this Paint is particularly adapted to structural iron work located on or near the seashore. The company have a sales office at 275 Broadway, New York.

ON FEBRUARY 27 the creditors of the Sun Vapor Street Lighting Company of Canton, Ohio, bought in the plant and business of the concern at auction sale for $87,025. The receiver has been operating the plant for the creditors for over a year and has made a profit. The company have lighting contracts for different parts of the country on hand, and the plant will continue in active operation.

THE WILMOT & HOBBS MFG. COMPANY, Bridgeport, Conn., whose rolling mill was burned recently, have made an adjustment of their insurance, which amounts to $63,000, and the company are now preparing to rebuild. A large fire proof main factory will be built, and other plans are being prepared looking to the construction of one of the finest plants in New England.

THE YOUNGSTOWN STAMPING COMPANY, Youngstown, Ohio, have been reorganized under the name of the Youngstown Specialty Mfg. Company. The stockholders of the new concern held a meeting recently and elected the following directors: Wm. R. Stiles, Alexander Dickson, C. M. Russell, Thos. Nesbitt, Charles J. Wick, J. Craig Smith, Henry Tod, B. F. Wirt and Geo. E. McNabb. The directors organized by electing the following officers: J. Craig Smith, president; William R. Stiles, vice-president; Chas. J. Wick, treasurer; W. C. Hine, secretary and general manager. The line of goods manufactured by the Youngstown Stamping Company will be continued by the new concern, and will consist of Glass Oil Cans, Galvanized Oil Cans in large variety, Water Buckets, sugar makers' supplies, Fruit Cans and Sheet Metal specialties of various kinds. These will be augmented by a full line of Lard Pails, Paint Cans, Baking Powder Cans and Spice Cans. The newly organized company start out under very favorable surroundings and the outlook for a prosperous future is exceedingly encouraging.

AMONG recently chartered corporations in New York State is the Estey Wire Works Company of New York City, organized to manufacture and deal in Wire Cloth, Iron Wire and Brass Work and Wire Goods; capital, $25,000; and directors, W. S. Estey, Cornelius P. McGuire and John C. Hessler of Brooklyn, and W. O. Chapman of Plainfield, N. J.

Plans have been completed for the consolidation in New York City of the Astor and Lenox Libraries and the Tilden fund, together with the private library of the late Samuel J. Tilden, under the name of the "Public Library of New York, Astor, Lenox and Tilden Foundations."

In an open letter written to the cotton growers of the South, A. B. Shepperson, editor of *Cotton Facts* and secretary of the Senate Sub committee on Agriculture, urges that food crops of every description should be raised on all Southern farms and that cotton should be made a surplus or money crop.

PLUMBING and GAS FITTING.

Association News.

New York State Plumbers.

The seventh annual convention of the Master Plumbers of the State of New York was held at Troy on Tuesday and Wednesday in Harmony Hall, which presented a pleasing appearance, having been tastlly decorated by the general committee of the local association. Large flags were draped at the rear of the platform and on the walls of the room, and small flags had been placed in the chandeliers. About 70 delegates attended the opening session. The delegates were introduced to Mayor Molloy by William H. Barnes, president of the local association, and the hospitality of the city was extended to the visitors.

The officers of the State association, who were nearly all present, are: President, William J. McDermott of New York; vice-president, Henry E. Wieber of Rondout; recording secretary, Chas. Schloesser of New York; financial secretary, Horace F. Wescott of Albany; treasurer, William G. Reid of Rochester. President McDermott opened the convention with an address and he was followed by Wm. H. Barnes. The convention then began its regular business.

The Committee on Credentials was James Temple, Troy; Henry E. Wieber, Kingston; J. C. Shumway, New York; J. Edward Janes, Albany, and John A. Creelman of Rochester. After hearing the report of the committee adjournment was taken until 2 o'clock in the afternoon. On the opening of the afternoon session Financial Secretary Wescott presented a report. Charles Schloesser, recording secretary, read a communication from Hudson plumbers, asking the aid of the State association to defeat the project to repeal the State plumbers' registration law so far as the clty of Hudson is concerned. The communication was laid over to be taken up in executive session. A number of recommendations to be acted upon at the next national convention were adopted. A musical entertainment was given in the hall in the evening for the diversion of the delegates.

Wednesday morning was largely occupied with the reports of the committees of the organization, President McDermott occupying the chair. The association received a communication from the secretary of the National Association of Master Steam and Hot Water Fltters, in which it was stated that the formation of a State organization for the latter body was contemplated and that a meeting for that purpose would occur the next morning. The communication requested the co-operation of the plumbers' State association and that the members attend the meeting. The association adopted a resolution approving the project, and giving as the sense of the gathering that it would be well for as many of the delegates as possible to attend the session of the steam and hot water fitters.

A resignation of the Brooklyn association from the State organization was received. A resolution was adopted directing that the resignation be held by the Executive Committee until after a committee of three from the association had conferred with the Brooklyn men. John Mitchell of New York, William Tobin of Syracuse and George Kirchoff of New York were named a committee to visit the Brooklyn association and induce it to continue its State membership.

A committee appointed to consider the action of the Executive Committee reported that the *per capita* tax of members of local associations belonging to the State association should be 75 cents. The *per capita* tax of members of the State association who were not a part of a local body was fixed at $5, $2 of which should be transmitted to the secretary of the National Association. This last named decree was adopted as a part of the constitution.

At the closing business session the officers were re-elected as follows:

President, William J. McDermott of New York.

Vice president, Henry E. Wieber of Rondout.

Recording secretary, Charles Schloesser of New York.

Financial secretary, Horace F. Wescott of Albany.

Treasurer, William G. Reid of Rochester.

The following were chosen delegates-at-large to the State convention: Wm. C. Vrooman of Schenectady; W. H. Barnes, Troy; John Yule, New York. Delegates to the national convention in June at Philadelphia: W. J. McDermott, John Yule and Charles Geiger of Buffalo.

The next State convention will be held in New York City.

Votes of thanks were given to the newspapers of Troy and trade papers for courtesies, and the local association, whose president is W. H. Barnes, received a special expression of gratitude for hospitality generously rendered. President McDermott spoke specially of Mr. Barnes' efforts.

The general committee of the Troy association of plumbers who had charge of the arrangements was: President, William H. Barnes; vice-president, James Temple; secretary, Wlliam F. Quinn; treasurer, William Ferguson; Martin Mulligan, Samuel Morris, Michael Kennedy, E. L. Murphy, George Bowman and Charles Wills.

After the adjournment the delegates and invited guests, numbering 150, were escorted to the banquet hall. William H. Barnes, president of the local association, presided, and on either side of him were John Mitchell of New York, president of the National Association of Master Plumbers, and William J. McDermott of New York, president of the State association. The other officers of the State association occupied seats at the president's table. After the banquet President Barnes, as toastmaster, introduced National President Mitchell, who spoke on "The National Association" in a forcible address.

State President McDermott outlined the purposes of the association and encouraged the members to renewed activity during the coming year.

J. L. Wells, chairman of the Executive Committee of the National Steam and Hot Water Fitters' Association, spoke on "Our Brother, the Steam and Hot Water Fitter." He referred to the intention to form a State association of the steam and hot water fitters. Vice-President James Temple spoke to the toast, "Our Local Association."

Samuel Morris was also called upon to speak, and he made one of his happy and effective speeches, wittily defending the plumbers from the criticism of the general public and other tradesmen and showing that the members of the plumbing trade were often compelled to bear censure which belonged upon the shoulders of others.

Edward W. Loth spoke for "Our Architects," and gave a tribute to the growth of sanitary science as illustrated in the plumbing of to-day.

In great good humor with the banquet and the successful convention, the assembly dispersed about 1.30 o'clock.

Ohio State Plumbers.

The annual convention of the Ohio State Master Plumbers' Association convened last week at Columbus and was opened by President Robert Raitz of Toledo. D. N. Kelly introduced Mayor Karb, who delivered a very happy address of welcome.

The work of the convention was then taken up. E. J. McNamara was made sergeant-at-arms and D. H. Roberts of Cleveland, W. P. Harper of Cincinnati and A. G. Miller of Lancaster were appointed a Committee on Credentials. A recess was then taken until afternoon, when the committee reported the following as delegates duly elected and authorized to sit in the convention: E. R. Brohl, Sandusky; J. W. Brown, Tiffin; Frank N. Olmstead, Conneaut; Charles Schriever, D. H. Roberts, A. L. Baker, Frank Feller, W. J. Worden of Cleveland; J. McVey, Lima; E. J. Nolan, F. E. Hopper, Charles Hicks of Cincinnati; W. G. Wacker, John E. Schultz, Al McLennan, Thomas Mannan, Toledo; A. G. Miller, Lancaster; James Sorenson, Ravenna; Thomas Clark, Mt. Vernon; H. Wilson, Defiance; E. Futerer, E McNamara and William Halley, Columbus; E. S. Collier, Uhrichsville, and R. P. Willis of Springfield.

The Auditing Committee was composed of Louis Poplowski, Cleveland; Ed. Freheren, Columbus; James Gibson, Cincinnati; and the Committee on Resolutions of E. Dolan, Cincinnati; Warden Clive and Mr. Olmstead, Conneaut.

President Raitz in his annual address recommended that the dues of the association be increased from $1 to $2 in order to make possible the employment of an organizer, whose business would be the better organization of craftsmen in the small towns and cities. This recommendation was adopted. He further recommended that closer relations be maintained between the association and the manufacturers and jobbers, and that co-operation with them

be made more of an object than formerly. The general object of the association, in brief, is to secure a better grade of plumbing, the adoption of laws, both State and municipal, and to see that those only are permitted to do plumbing who are thoroughly competent and skilled workmen. To govern and control prices is not one of the objects of the organization.

A plumbing law was presented and it was decided to recommend its passage by the Legislature, and the Legislative Committee was instructed to present it for consideration at the next session.

The officers elected were as follows: President, Edward A. Futerer of Columbus; vice-president, E. J. Nolan, Cincinnati; secretary, Samuel Eswein, Columbus; treasurer, William Halley, Columbus; members of the Executive Board at Large, F. Hopper, Cincinnati; J. E. Schultz, Toledo; E. R. Brohl, Sandusky, and the retiring president, Robert Raitz of Toledo.

Delegates to the national convention to be held in Philadelphia were selected as follows: Louis Poplowski, Cleveland; J. M. McVey, Lima; alternates, F. Hopper of Cincinnati and A. G. Mills of Lancaster.

The next State convention will be held in Cincinnati in February, 1896.

An address was delivered by Inspector of Buildings Harris on the subject of plumbing in its relation to heating and ventilation. P. J. Magley also responded in a neat address to an invitation to talk to the convention.

The visiting delegates went to the Grand Opera House as the guests of the master plumbers of the city. Harrie D. Crane of Cincinnati, president of the National Association of Master Steam and Hot Water Fitters of the United States, was among the guests. After the theater all the delegates participated in a "Dutch lunch" at the Grand Central Hotel.

About 70 were seated in the dining room and enjoyed the tempting spread. Following the banquet came a season of speechmaking, story telling and singing, which lasted until an early hour in the morning.

THE PLUMBERS of Chester, Pa., are taking active steps for the organization of a master plumbers' association, and held their second meeting for the purpose of furthering the preliminaries last week. Another meeting will be held on Monday evening, March 11, when it is hoped to perfect the organization.

ABOUT 20 MEMBERS of the St. Louis Master Plumbers' Association and the Central Supply Association met in the Southern Hotel, St. Louis, last week to talk over matters of mutual interest.

THE MASTER PLUMBERS of Newburg, N. Y., held a meeting last week in the room of the Inspector of Plumbing at the City Hall. A. C. Smith was elected chairman and A. H. Pickens secretary. An informal discussion was held, lasting over an hour, but no organization was completed and an adjournment was taken subject to the call of the chairman and secretary.

THE Master Plumbers' Association of Toronto, Canada, has elected the following officers: President, Thos. Cook, 320 Parliament street; first vice-president, W. J. Burroughs, 353 Queen street west; second vice president, Geo. Guest, 71 Queen street east; secretary, K. J. Alison, 668 Yonge street; treasurer, A. Fiddes, 50 Jarvis street; sergeant-at-arms, Walter J. Garratt, 128 Bay street. The Executive Committee will consist of these officers, exclusive of the sergeant-at-arms.

Chicago Apprenticeship Code.

An apprenticeship code has been agreed upon by the Chicago Master Plumbers' Association and the journeymen's association, which will command the attention of all who are interested in the plumbing trade. There had been a code in use by some of the Chicago master plumbers for a number of years, and, later, Articles of Agreement were accepted by the two associations, which contained a section providing for an apprenticeship code. This code, which has now been adopted, is as follows:

ARTICLE 1. The term of apprenticeship shall be five years. The apprentice shall first register with the secretary of the C. M. P. Association, and after satisfying him of his ability to learn the trade he issues him a card to be retained by him during his service with him or any other employer. Said card must show five years' actual service. If he desires to leave he must apply to the secretary of the C. M. P. Association, who issues him a transfer after consulting his former employer.

ARTICLE 2. The apprentice for and during his five years' apprenticeship shall be under the jurisdiction of his employer.

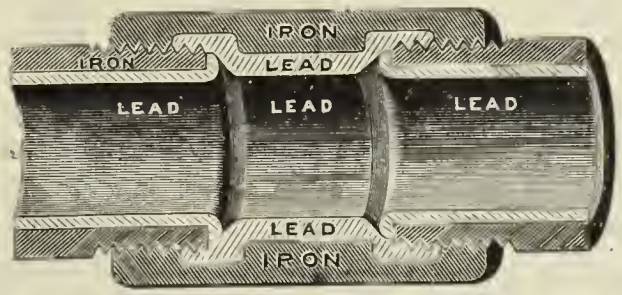
ARTICLE 3. After serving his five years' apprenticeship he shall be examined by an examining board composed of the president and secretary of the C. M. P. Association, the president and secretary of the C. J. P. P. and B. Association, and the chief inspector of the Health Department of the city of Chicago, and if found competent by the board of his ability to act in the capacity of a journeyman plumber, he shall receive a card which entitles him thereafter to the standard rate of wages.

ARTICLE 4. Each employer may employ apprentices in the ratio of one to every two journeymen plumbers; provided, however, that each employer is entitled to one apprentice in each shop.

ARTICLE 5. Each employer may employ what is now known among the trade as junior plumbers in the ratio of one to each journeyman plumber; provided, however, that each employer first employs a journeyman plumber before employing a junior.

ARTICLE 6. It is expressly understood that no journeyman, junior or apprentice shall work for any employer in any shop where these rules are not enforced.

ARTICLE 7. All junior plumbers who may be working at the trade and belonging to the juniors' union at the time that this agreement is ratified by both associations, shall be left to the discretion of the examining board, ascertaining the length of time he has served and his knowledge of the trade, and if any are found competent to act in the capacity of a journeyman plumber, he shall receive a card which entitles him to the standard rate of wages.



ARTICLE 8. The sons of master plumbers now at the trade shall not be controlled by this apprenticeship code, but all that start at the trade after the ratification of this code shall be controlled by it.

ARTICLE 9. After the ratification of this apprenticeship code by both associations the examining board shall meet as soon as possible to arrange the methods by which examinations shall be made.

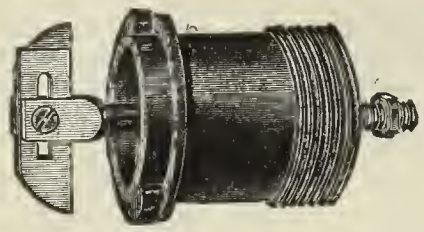
Lead Lined Iron Pipe.

An article of wide interest and adaptability is shown in the picture of lead lined iron pipe herewith. It is manufactured by the Lead Lined Iron Pipe Company, Wakefield, Mass., who guarantee all their pipe and fittings to stand



Lead Lined Iron Pipe.

a water pressure of 300 pounds. The pipe is made in 16-foot lengths in all sizes from ½ inch to 4 inch and a full line of cast iron lead lined fittings are made for use with the pipe. The pipe is adapted for water or gas mains, and owing to the smooth inner surface it makes an excellent soil pipe, there being nothing on which there may be an accumulation, and a single flush clears the pipe. The fittings have a portion of the thread in the lead, so that water does not come in contact with the iron. In working the iron pipe may be cut with an ordinary pipe cutter, but the lead should not be cut until the two parts are slightly separated, then the lead lining should be cut with a knife and the end finished with a special tool that is furnished free for the purpose. In making up the joints no paint or cement is needed, as the lead lining of the pipe beds tightly into the lead lining in the fitting. The lead lining affords an excellent protection for the iron against rust and effectually stops all pin holes, sand holes, &c., and prevents, it is said, the leakage of gas even under pressure. For a vent pipe on a plumbing system there is no possibility of rust scales dropping down and closing the bends when the traps are likely to be siphoned. For exposed plumbing it presents a neat appearance as a soil pipe, and claim is made that it has all of the advantages of brass pipe at a much less cost. Over 2,000,000 feet of the pipe are said to be in use, and it has been used as a supply pipe in the Lincoln School and Armory Building in Wakefield and in the Carter office

building in Boston with satisfaction. The pipe is being used by a number of leading New England plumbers and in some fine buildings.

Salvage Closet Connection.

Sproul & McGurrin, 186 East Fulton street, Grand Rapids, Mich., have brought out the salvage closet connection herewith illustrated, which is designed for the repairing of earthenware closets of all kinds when the flush or

Salvage Closet Connection.

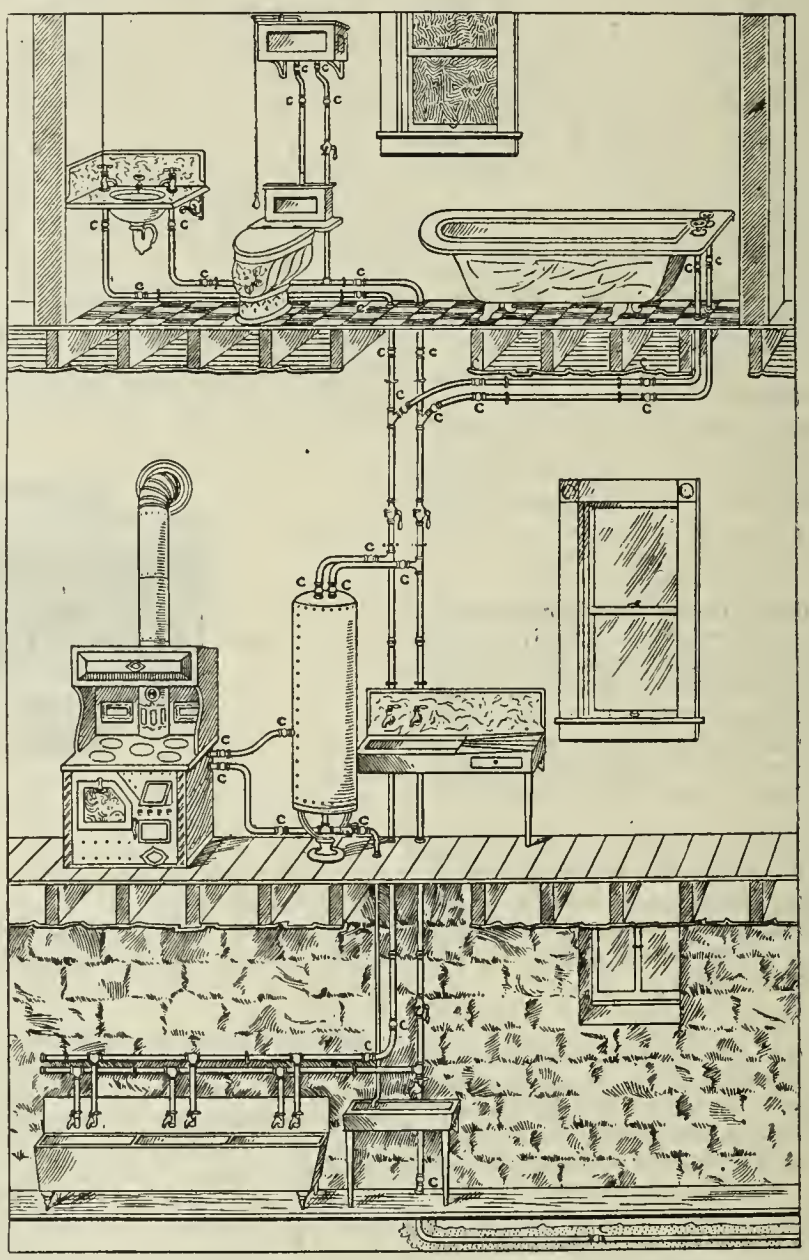
revent horn is broken off. It can be attached without removing the bowl, has the standard thread and can be put in place if only a part of the horn is broken off, without the necessity of having the balance smooth. The manufacturers state that this will not only save the closet, but will make it better than new.

The Star Couplers on Supply Pipes.

The accompanying illustration, which shows a sectional view through a house, indicates the application of the Star coupler to the supply pipe plumbing. These couplings, which have been illustrated in the columns of *The Metal Worker*, are useful for making various joints, as the diagram indicates. The illustration shows a system in all of which the straight sections are of wrought iron pipe and all the tees, ells, crosses and fittings, bibbs, cocks, stops and wastes are for iron pipe, while all the curves and rounded sections are of lead pipe, the connection being in all cases made with the Star coupler. The coupler is a mechanical connection and is said to make an absolutely water tight joint under any pressure or temperature and a joint that can be uncoupled and coupled up again when necessary.

TRAPS AND VENTS.

Wolcott & Pratt have bought out the firm of C. N. Allen & Co., Newtonville, Mass. They came from Amherst, and have both had a practical experience in the business of plumbing and steam and hot water heating.



Abel P. Randall has leased the rooms in Dixon House Court, Westerly, R. I., for a gas fitter's and plumber's establishment.

John Delahunt of Fall River, Mass., who lost three children from alleged defective plumbing, has begun suit in the name of one surviving child for $5000, alleging that the illness was caused by a defective drain pipe due to the negligence of the landlady.

The plant of the National Lead Works has been removed to Cincinnati, Ohio, from Louisville, Ky., where it has been operated for several years. This concern will give employment to a number of men.

The Humphrey Mfg. & Plating Company of Kalamazoo, Mich., have issued a very attractive catalogue of their automatic instantaneous gas hot water heater. This is a combined instantaneous water heater and bathroom warmer. The burner is so arranged that it can be swung out from under the heater, and in that position can be used to warm the bathroom. An automatic valve is used to prevent accident in case the supply of water should give out or the operator forget to turn it on. The gas burner cannot be lighted under the heater unless water is actually flowing through the valve.

Thomas Wall, Jr., and Michael Walsh have been registered proprietors of Wall & Walsh, and Wm. and Wm. Henry Murphy have been registered proprietors of Wm. Murphy & Sons, plumbers, Montreal, Canada.

The Star Couplers on Supply Pipes.

Kelly & McCormick is the name of a new plumbing firm at Ottawa, Canada.

J. C. Murray has moved his plumbing and tin shop to the Krogh Building on K street, Tulare, Cal.

Dansburg Brothers & Blake have opened a plumbing shop on Sumner street, La Crosse, Wis.

John L. Knowles of Carnegie, Pa., has just completed arrangements to open up a branch of his business at 1008 Eleventh avenue, Altoona, where he will handle all kinds of electrical and plumbers' supplies.

Arthur T. Pratt and Walter B. Wolcott of the firm of Pratt & Wolcott, Newtonville, Mass., both passed successfully the examination for master plumbers.

C. L. Hicks, who was burned out recently, has leased the large store on the corner of Phœnix and Abbott avenues, Waterbury, Conn., which he is now fitting up for his plumbing business.

Andrew J. Fiske, one of the prominent business men of West Newton, Mass., died of pneumonia at his home on Henshaw street, on Wednesday. Mr. Fiske was 56 years of age and was born in Framingham, where the members of his family were old residents. Mr. Fiske went to West Newton about 30 years ago and had since conducted a plumbing and hardware business on Watertown street. He was at one time elected on the citizens' ticket to the common council and served one term.

All the sewer pipe concerns located in Ohio, Virginia, Pennsylvania and New York, with the exception of one Pennsylvania concern, have formed a combination. It has been decided that the works making sewer pipe from fire clay shall sell all their goods through the Central Sewer Pipe Company, with offices in Pittsburgh, and those making sewer pipe from shale will sell their product through the Union Sewer Pipe Company of Akron, Ohio.

The plant of the Sharon Clay Mfg. Company, Sharon, Pa., manufacturers of vitrified salt glazed sewer pipe and building blocks, resumed operations on

the 25th ult., giving employment to 60 hands.

THE PLEUGER & HENGER MFG COMPANY, St. Louis, Mo., issue under recent date their No. 8 catalogue of water works specialties. In an announcement to the trade they call particular attention to their line of water works specialties, especially their large variety of hydrants, which they say are constructed upon the best mechanical principles. Service boxes, valve boxes and gate valves occupy the first 20 pages of the pamphlet. Then come their hydrants, of which a very great variety is shown. The hydrants are illustrated by general and sectional views and full descriptive particulars are given, so that a thorough understanding of their constructive features may be readily obtained. Tables of sizes and prices accompany the illustrations. Street washers are shown in large variety and a number of special hydrants, self-closing and non-wasting and other kinds. The larger part of the pamphlet is given up to goods of this sort, and any one having need of water works specialties of the kind indicated will find a very large assortment to choose from in the goods of the Pleuger & Henger Mfg. Company.

AT A GENERAL MEETING of the Board of Health of Schenectady, N. Y., the following communication from the Board of Plumbers and Plumbing was received and adopted: "*Resolved*, that the water test now in use in this city for the inspection of plumbing work be kept on all soil and drain pipes not less than five hours, and that the test also include all lead bends and rough lead work under the floor or floors."

THE WILKINS MOTOR PUMP OR HYDRAULIC WATER LIFTER is illustrated and described in a little pamphlet distributed by the Columbus Brass Company, Columbus, Ohio, who manufacture the engine. It is a very compact and serviceable pump, and those interested in it will find complete illustrations and descriptions in the pamphlet. A number of testimonial letters refer to the excellent working of the machine. The firm also manufacture water closets, sanitary cabinet work, lavatories, stop cocks, &c., of which brief reference is made in the circular.

PROF. JOHN A. BARRETT, in a special report of the Subway Commissioners to Mayor Schieren of Brooklyn, states as the result of his investigations that it appears indisputable that earth currents from trolley roads in that city are causing extensive electrolysis of water pipes and other pipes and conductors imbedded in the ground at an indeterminate but serious rate. It also appears that there are practicable means at command which are being neglected, and which, if properly organized and applied, would largely abate if not altogether arrest the ongoing destruction.

AT THE EIGHTH ANNUAL MEETING of the Master Builders' Exchange at Philadelphia, held recently, it was reported that the Mechanical Trades Schools attached to the exchange had enjoyed a prosperous year. The classes were well patronized, especially in the plumbing class, although the stonecutting and blacksmithing classes had not their full quota of pupils. In order to increase the efficiency of the schools, a bill has been prepared and presented to the Pennsylvania State Legislature asking for an appropriation in support of the schools. The exchange has an endowment fund on hand amounting to $6245, which has been invested in bonds and notes of the exchange for the benefit of the Mechanical Trades Schools.

A NEW steam and gas fitting and plumbing establishment is to be opened in the Fleming Block on Second street, Little Falls, N. Y., about March 1, by Bradford & Co. Mr. Bradford has been employed by McDermott & Ashenhurst. He has engaged a first-class plumber and will be prepared to do all kinds of work in their line.

JAMES GIBSON, a contractor of Sandy Hill, owns three houses in Victory avenue, Schenectady, N. Y. Lately finding some plumbing work needed in the houses he proceeded to do it himself. This was in plain violation of the provisions of the plumbing code. Gibson was arrested upon the charge and brought before Justice Eisenmenger to answer. The Justice stated that as this was the first offense he would heed the plea for extenuation. He therefore fined the accused $15.

JOSEPH J. CASHEN, Meriden, Conn., who for many years has worked for his brother, William B. Cashen, is soon to go into the plumbing business himself at 65 Church street.

BAUER & SCHNAITTER have removed their plumbing establishment to the new Cable Block on Market street, Sandusky, Ohio.

GLEASON & LANE'S plumbing store, Cortland, N. Y., was visited by a small fire last week.

DESMOND & WARD have opened a new plumbing shop in Roberton's Block at 91½ Salem street, Glenwood, Mass.

WEST & BRANCH, a Richmond, Va., plumbing firm, have dissolved partnership.

MCONEY & BAINE, plumbers, Nashville, Tenn., have dissolved partnership and T. J. Mooney will continue the business.

THE PARTNERSHIP heretofore existing at Louisville, Ky., in the name of the Smith Strouse Plumbing Company, has been dissolved.

ROBERT J. MOONEY had a small fire in his plumbing shop at Summit, N. J., last week.

THE BILL before the Tennessee Legislature providing for a plumbing inspector in towns of 5000 inhabitants has passed the second reading.

ANDREW MOE, late of the firm of Heckstadt & Moe, has opened up a new plumbing shop, 202 Kelsey street, Eau Claire, Mich.

THE BOARD OF HEALTH of Hudson, N. Y., have decided to retrench in the expense of city government by dispensing with the Examining and Supervising Board of Plumbers and Plumbing, and have petitioned their representatives in the Legislature to have the town of Hudson exempted from Chapter 602 of the laws of 1892.

TWO GAS LEAKS that might have proved disastrous have been caused in Brooklyn by thieves, who cut off the lead pipe on the gas meter connections.

WM. WASHINGTON, who has had charge of F. J. Hoffman's plumbing department and tin shop at Fenton, Mich., for the past two years, will open a general plumbing and repair shop at Marlett.

R. M. WILSON, Rome, N. Y., and 92 Walker street, New York City, is sending to the trade a four-page circular of the Solid Sanitary copper bathtub, which has been recently put on the market. The circular is printed in two colors, the picture of the tub being a copper color.

CHAS. P. VANDEVEER, formerly with Dubois & Darrow, is now on the road representing Dimock, Fink & Co., 80 John street, New York, who carry a full line of plumbing supplies.

C. V. HAYNES was in New York recently visiting the plumbing trade in the interest of the King trap, made by the King Mfg. Company, West Troy, N. Y.

JOS. J. MCCABE, Boulder, Col., has sold out his plumbing business to C. F. Wills & Co.

THE AMERICAN TUBE WORKS, Boston, Mass., are issuing a new catalogue of their seamless drawn brass pipe for plumbing, which they say is tested to 1000 pounds hydrostatic pressure. Sixty pages are used in giving the names of plumbers in different cities and the names of their customers where brass pipe has been used in plumbing. In a recapitulation of the buildings it appears that their brass pipe has been used in 18 club houses, 100 homes, hospitals and hotels and over 700 private residences.

WE ARE INDEBTED to the Goulds Mfg. Company, with main office and works at Seneca Falls, N. Y., and warerooms at 16 Murray street, New York City, for their illustrated catalogue and price-list of pumps and hydraulic machinery. The volume, which bears date of the present year, is the thirty-fifth edition of their catalogue, and is a most elaborate and valuable publication for those who wish to keep informed of what is in the market in the line of hydraulic machinery and pumps. The volume, of oblong shape, measures 8¼ x 7¼ inches in size, is handsomely bound in linen, with the title and firm name in gilt letters. As showing the extended assortment of goods made by this well-known firm, it may be mentioned that there are over 350 pages in the catalogue, nearly every one of which contains one or more illustrations of goods which they make. To assist the buyer in searching out the articles he is after in so large a volume, a carefully arranged alphabetical index is given at the beginning of the book, while at the end is an index of figures. All sorts of pumps for all sorts of purposes are included, it being impossible even to enumerate them, there being small pumps for domestic work and large ones for greater service. Power pumps of many kinds are shown, likewise electrical pumps, water rams, air pumps, spraying pumps, hydrants, sinks, drive well points, drills, valves, cocks, taps and dies, &c., are some of the miscellaneous goods that are included. The catalogue contains many new goods and illustrations of their application which have not before been published that will interest the hardware and plumbing trades, to whom the book will be furnished on application.

An engineering undertaking of no small difficulty is to be carried out as soon as the weather will permit on the steel bridge of the New York, New Haven & Hartford Railway over the Thames River, between New London and Groton. The draw of the bridge, which is one of the largest in the world, has worked eastward about 8 inches, and the task before the engineers is to pick up the eastern span and launch it just that distance toward Groton. It weighs 2,600,000 pounds.

STOVE TRADE NOTES.

The Local Stove Trade.

The local stove trade during the last four or five weeks has been in a fairly satisfactory condition and indicative of gradual improvement. To make this assertion without some qualification, however, might be misleading, for the experience of many would be at variance with the statement. After such prolonged depression, signs of first improvement will by many be hard to detect and will be found to exist at first with the larger houses having a line of customers taken from all neighborhoods and from all classes. While with such houses a slight increase in all departments and for nearly all the different grades of goods—cheap, medium and high priced—indicates general improvement, it would affect the small trader so very little that many would be unable to note any change at all. The matter of a sale by such traders of one or two more stoves for a corresponding period, or an increase of a few dollars in the business, might be put to the score of chance rather than improved condition.

Some doubt of an upward turn to business may yet be admissible, and favorable accidental conditions may underlie the increase in the stove business not only during the last four or five weeks, but thus far during the year. Until, however, the year grows older and present indications are set at naught by reverses, there is ground to believe that the tide has set toward better business.

The extreme cold wave last month had some influence on trade and added to the demand in February this year over February of a year ago. Extreme cold cannot be too lightly considered in its bearing on the stove trade, even coming, as the late blizzard did, when the stove business was practically over for the season. To whatever extent it was better because of business improvement it was benefited by the cold wave, of course, and helped to make of February a good month. It is a satisfaction, even if general business is not greatly on the mend, if accidents or abnormal conditions of weather shall give the stove business a special impetus in every month during the year. Had the terribly cold weather continued longer it might not have helped as much as it did, for it would have interfered more with the spring trade, which, from present appearances, may not be delayed beyond the ordinary time when spring activity, governed by the breaking of winter and opening of navigation, usually sets in. The increased trade in February among the larger wholesale houses was equal to the January increase.

As to the future of the stove industry, it is getting to be a question what the term "stove business" now implies and embraces. It has heretofore been confined to the manufacture and sale of cooking and heating constructions for coal fuel, and gas, gasoline and oil appliances have been put in another class, and were for a long time considered as enemies of the regular stove business and counted among the elements of destruction and against the interests of that industry. It is a question whether they should not be nowadays considered as a whole, owing to the extent to which manufacturers, jobbers and retailers include these constructions in their lines and the constant addition of new appliances burning these fuels which the stove trade seem more and more eager to take in to supply the gradual falling off in demand for some coal constructions, owing to the encroachment of these new devices.

The Ohio Stove Trade.

The majority of the reports from manufacturers of stoves and ranges in this section are encouraging, but there are a few founders who are still experiencing unsatisfactory returns for efforts expended upon the trade. With one exception information received from the trade this week testifies to the fact that a larger volume of business was transacted in February this year than in the corresponding month last year, and one manufacturer reports an increase of 100 per cent., and all manufacturers heard from unite in the belief of more confidence among buyers, with more disposition to anticipate wants than heretofore. Though there is a steady and gradual improvement, the resumption of normal conditions is not anticipated until the laboring classes are more fully employed.

But while the increase in the volume of business is a matter of congratulation, there is not a little complaint of low prices and small profits, nor does there seem to be any immediate prospect of a change in this respect. This could hardly be expected, however, as yet and can hardly be looked upon as a discouraging feature, all things considered.

Dealers and manufacturers in Indiana as well as Ohio report accumulated orders and increased activity in making shipments. Orders for pig iron from stove foundries do not indicate any unusual activity, but there is a fair buying movement of a healthful character.

Money in this market continues active, manufacturers being among the largest borrowers, and rates of interest have still further hardened during the week. The outgo of currency to the country, too, has continued on a liberal scale, the reduction in the readily available supply having a marked effect in shaping the course of the exchange market.

The Manufacture and Sale of Warm Air Furnaces from New York State and its Effects on the Heating Stove Trade.

BY WILLIAM H. LANDERS, SUPERINTENDENT SYRACUSE STOVE WORKS.

In the year 1875 the writer was an apprentice in the stove and hardware store of Owen O'Neil, Son & Co., Utica, N. Y. Their business was selling at retail stoves, furnaces and shelf hardware. They also conducted a large job shop for all kinds of heavy work in sheet iron, copper and tin, and which was successfully carried on. This establishment was started in 1816 and had proven a successful enterprise for its owner, who had amassed a fortune from conducting it during these long years. Some well-known manufacturers and mechanics have worked in this shop in its earlier years. One of these was Henry Burden, the originator of the Burden Iron Works in Troy. He was in his earlier days befriended by Owen O'Neil, who helped him in his first steps to successfully establish his business, which is famous throughout the country at the present time. There was the late John Carton, who constructed the first Carton furnace, who in those days was noted as a skilled coppersmith and all-round mechanic, and afterward became head of the Carton Furnace Company, and when he died left his sons a splendid reputation as mechanic and business man.

In this store on an average about 500 stoves were sold annually. Half of these stoves were principally heating stoves of the various kinds made at the time. Their leaders were the Shining Light, made by Bussey & McLeod, and the Light House, made by Ransom & Co. Both of these stoves were successful in working qualities, and many of them are in use at the present day. They proved profitable and popular sellers, and the stove business was always a profitable one. Utica then contained a population of about 35,000 people,

and had ten retail stores, two of them being manufacturers of stoves who also did a retail business. We are merely illustrating what one concern did in those days of selling heating stoves and I suppose it would be a fair average of every house throughout the State in towns of the same population. That volume of business in selling stoves was satisfactory to manufacturer and retailer. No one will deny that business was so that all the men were compelled to work overtime to keep up with the rush during the fall months.

Very few furnaces were then manufactured in New York State outside of Albany, Troy and New York City, and, as an indication of the comparative number of stoves and furnaces sold, the firm mentioned in that year sold only two brick set furnaces of the Culver make. One of these was sold to a jeweler in Utica, and the other set in a church at West Winfield, which was about 30 miles south of Utica. It was an extraordinary thing to sell a furnace, and when sold the average price was in the neighborhood of $400 or $500, and consequently only those who could well afford it would purchase a furnace. The local trade in Utica was principally Richardson & Boynton's and Carton's. Mr. Carton, Sr., personally measured, inspected and saw set up all of his furnaces which were near by, and their success locally no doubt was due to the carefulness with which they were set. This gives us a fair presentation of the comparative standing during the early seventies of the trade on heating stoves and furnaces sold by an average dealer who was not a manufacturer of either. It is hard to realize that this was but twenty years ago, in view of the changes that have occurred in that period.

The firms who had a reputation as furnace manufacturers in those days were Richardson & Boynton of New York City and Fuller & Warren Company of Troy. These two concerns practically controlled the furnace business throughout the State. Boynton's Gas Tight and Lawson's Ruby furnace were standard goods, and were known by their reputation. It was almost impossible to try to convince a dealer that any other furnace had any merit. Five years later, 1880, was the commencement of the boom in the manufacture of furnaces and the gradual decline of parlor stoves. In that year the manufacture of furnaces became a feature of great importance to foundries that were more or less interested in the melting of iron. Commencing at Buffalo, we find the Harris furnace manufactured merely in a local way. At Rochester Trotter & Geddes did quite a local business. At Syracuse John F. Pease & Co. manufactured the Economy furnace, and had just become fairly well established and were branching out for the wholesale business. At Utica the Carton Furnace Company were showing a spirit of progress and were pushing outside for trade. We believe the first example of real enterprise shown in the manufacture of furnaces to which today Utica owes so much was the endeavor of Mr. Francis Kernan, who successfully organized, created and built up a business on the Palace King and Queen furnaces. At Albany Perry & Co. were making the Standard; Fuller & Warren Company were at Troy, while M. Mahoney and Henderson were well known as furnace manufacturers. In New York City there were many local manufacturers: Richardson & Boynton, Boynton Furnace Company, Thatcher Furnace Company, Abendroth Bros.' Union Stove Works, J. L. Mott Iron Works.

This may not be a complete list, but it will give an idea of a number of firms who at that date, 15 years ago, were manufacturing furnaces in a general way. The convenience and comfort of furnaces and the lower range of prices made them more popular, while the better heating of all rooms in a house and the saving of labor for those who carried coal and ashes were thoroughly impressed upon the people, especially upon those building new houses, and furnaces were commencing to find a ready sale. More brick set furnaces were sold at that date, and the simpler portable furnaces had not been well introduced, for as a rule they were not considered as good a furnace, as so much of the heat was lost by radiation, and the brick set was more profitable.

During the 80s all the different manufacturers pushed sales throughout the State and other States and into other fields, and the business became more profitable. Greater enterprise and more salesmen were added and the capacity of the different foundries was increased to take care of the increased business. The chief trouble then was the want of practical knowledge of the different dealers as to how to set a furnace to get good results from it, and in some cases many furnaces were taken out for not being as represented, and the result was the manufacturers were compelled to have salesmen who possessed a practical knowledge and ability to successfully sell and set and instruct dealers in order to get satisfactory returns at the end of the year. After one or two seasons dealers became more practical and showed more enterprise, and competed more for the sale of furnaces, and the result was the writer has seen in small country towns 25 and 50 furnaces set in a single season, and the sale of a furnace, it must be remembered, is equal to at least two parlor stoves.

To show the production of furnaces we will take the average year, say, 1890 and offer as an estimate made merely from observation the following number of furnaces: Buffalo, 500; Rochester, 500; Corning, 500; Syracuse, 2500; Utica, 8000; Troy, 1500, and New York City 8000 furnaces, or in all over 20,000 furnaces. These 20,000 furnaces will take the place of at least 40,000 parlor stoves. Every dealer in the stove and range business will agree with the writer that where a furnace is put into a house ordinarily there is a parlor stove used in the parlor and sitting room and one in the bedrooms or the second story. One or more parlor stoves will be used according to the size of the house. In some places, no doubt, furnaces will take the place of three parlor stoves, so in averaging it up that two parlor stoves are displaced by one furnace, we believe we are perfectly sure that in selling these 20,000 furnaces the manufacturers of heating stoves are deprived of a business equal to 40,000 parlor stoves. We do not believe that in the exchange of the heating apparatus from parlor stoves to furnaces retail dealers have made any more money on the sale of furnaces. The change has made a larger volume of work and it has increased the sale of many other things which go to make up a furnace business. No doubt the volume of it in dollars and cents is larger than it would be if it had been parlor stoves.

Competition on furnaces since 1890 has been fierce both in retail and wholesale, and prices have gradually declined. We do not believe the retailer has made any more money on furnaces than he did on a good sized range or parlor stove. The sale of furnaces has, however, been productive of some good things, for the middle classes, who are consumers of heating stoves, have been able to exchange them for a furnace at a cost of from $100 to $150 for an ordinary eight-room house, and with greater comfort, no doubt, as the result. It is now the modern way of heating houses ranging in price from $1000 to $5000; houses that cost above the latter figure being more apt to use steam and hot water, as the owners are able to buy the more expensive and, we believe, the more thorough heating plant.

In discussing the conditions existing in the local stove trade a writer in one of the Albany papers intimates that improved systems of heating have had a marked effect in reducing the demand for parlor stoves. In recent years there has been a widely extended movement toward an improvement in heating methods, and in every new house hot water heaters or steam pipes are placed about it in such a way as to make the establishment comfortable while stoves are relegated to the background. This change in the method of heating has seriously affected the sales of stoves, and in the opinion of a prominent dealer these constructions are likely hereafter to be used almost exclusively for cooking purposes. Dealers, however, seem to have some hope for next year. The severity of the cold during the last two months has necessitated hot fires, and many old stoves have been burned out. The effects of this will be felt next fall, when it will be necessary to replace them with new stoves. The writer states that the business of the stove dealer has been far from a profitable one during the past winter.

ODD PLATES.

The Eclipse Gas Stove Company of Rockford, Ill., issue gorgeous diplomas to those who are deemed worthy of the honor conferred. The diploma sets forth that the person named is a graduate in the school of the Ancient Reckless and Independent Order of Prevaricators and is permitted to continue lying—ghost, fish, war and mother-in-law stories excluded. The signatures are R. E. Morse, president of the school of liars. and U. R. A Nother, secretary to His Infernal Majesty. We are not advised that the distinction imposed by this diploma is an honor eagerly coveted and highly prized when obtained.

The Peck Williamson Heating and Ventilating Company of Cincinnati have opened a branch house at Webster City, Iowa, making that city a distributing point for Iowa, Nebraska, the Dakotas and Minnesota. E. R. Swan is the manager of the Webster City branch.

The Michigan Stove Company use postal cards of their own design, varying decidedly from those furnished by Uncle Sam. Some of these cards are of linen, some are wood but all are unique. They are generally of large size, so as to be conspicuous in the mails. The latest one issued is a large card 7½ inches long by 4¾ inches wide. The side for the address is perfectly clear, containing nothing but the address of the person to whom it is sent. Turning it over, a handsomely printed and strongly worded advertisement of Garland stoves is read, the point of which is that the Michigan Stove Company undertake to protect legitimate dealers. Garland stoves are not found in department stores, furniture stores, &c.

We are indebted to Isaac A. Sheppard & Co. of Philadelphia, Pa., and Baltimore, Md., for a series of handsomely printed circulars illustrating and describing some of their leading specialties. The first of these circulars relates to an entirely new line of portable ranges known as the Royal Excelsior, a substantial construction of rich and effective ornamentation. This range has been designed to meet the requirements of dealers in towns in which the old style cook stoves still retain the favor of many buyers as well as of those dealers with whom the range business has become well established. The Royal Excelsior is made in a number of styles and sizes and is adapted for use with either hard or soft coal or wood. Among the leading features may be mentioned large end hearth which slides forward, exposing a roomy ash pit with bailed cast iron ash pan, large swinging end door with ample draft slide, capacious flues, Duplex, Dockash or shaking and dumping grate, which can be quickly removed without disturbing either the water front or brick linings and feet, which are independent of the skirt base. Another circular, which is printed in colors, relates to Royal Fidelity ranges intended for burning hard or soft coal, coke or wood. The wide popularity of these goods has caused the manufacturers to add a larger range of this class to the assortment of sizes and varieties heretofore offered. The Royal Fidelity is fitted with horizontal boiler made by the company of the best material, riveted and finished by hand, a pressure of 150 pounds per square inch being guaranteed. The range embodies the modern features and is ornamented in a style which is both clever and effective. The goods are offered in portable form and also for brick setting. The third circular deals with the Fidelity fire place heater, a very attractive stove designed, the makers state, to secure the most pleasing appearance and the most efficient service possible at a moderate cost. It is made of cast iron throughout, has heavy fire pot, draw center grate, inside magazine cover, brick linings above the fire pot, dust flue and cast iron ash pan.

John Thompson, who was for a number of years foreman of the molding department of the Clinton Stove Works, at Troy, N. Y, died at his home in Lansingburg, February 28, at the age of 58. He had been ill for six weeks from an injury sustained at the foundry. An operation was performed in the hope of saving his life, but was not successful. The deceased was an upright citizen and a trusted employee of the Fuller & Warren Company. He was a Knight Templar and a veteran of the late war. He leaves a family.

President Nathan B. Perry of the Perry Stove Company, Albany, N. Y., says regarding the stove trade: "In common with most other branches of business the stove trade has not been up to the standard, but we are hoping for an improvement this year."

B. B. Nickerson, for a number of years in charge of the office of the Spicer Stove Company, Providence, R. I., and well known to every one who has visited that establishment, is now representing the company on the road in New England, where he will push the Model line of stoves and ranges. If Mr. Nickerson is received by the trade with half the courtesy he has always displayed toward visiting traveling men, his lines will fall in pleasant places.

According to our English exchanges, the recent prolonged spell of severe cold weather in that country caused a remarkable increase in the demand for gas and oil stoves. The comfort and convenience of these appliances for heating small rooms not supplied with regular fire places has received a recognition never before accorded to them, and their use is likely to be largely stimulated in the future.

Isaac A. Sheppard & Co., Philadelphia, are putting on the market the Royal Excelsior range, which is of the high oven type and high grade. It is made with high shelf, high closet, end ash pit, with bailed pan, water fronts, reservoir with their patent spigot, Eclipse covers which lift from the middle and nickel trimmings. The range has many other attractions, including an attractive proposition. If a dealer orders one, gives it a high polish and displays it conspicuously, and is not satisfied that it is a seller, he may return it inside of 30 days. If kept longer it is a sale.

L. E. Roberts and J. Snyder of the Thomas, Roberts, Stevenson Company, Philadelphia, were visitors at the New York office, 250 Water street, this week. They are placing an oven thermometer in the oven door of their gauze door ranges to aid the cook in correctly gauging the temperature in the oven. They report that the step has been very popular with the dealers and their customers.

The Lehigh Stove & Mfg. Company, Lehighton, Pa., are using the Cooper oven thermometer in their Model Lehigh range. They say: "It tells the cook when the oven has reached the right heat and helps to keep it there." G. W. Baeder is calling the attention of the trade in New York and vicinity to this feature and their general line of Lehigh goods.

The Estes Stove Company have been organized at Birmingham, Ala., to carry on the business hitherto conducted by the firm of Penninger & Estes.

Luther & Lederhos have moved their gas stove shops and salesrooms to 9 and 13 Desbrosses street, New York.

Sam S. Utter, 113 Beekman street, New York, recently made a visit to Boston, Mass., where he moved his stock to a more commodious store at 79 North street. The new store is under the management of H. C. Whitten. In Louisville, Ky., his line of oil stoves will be handled by the O. K. Stove & Range Company.

W. Jackson's Sons, 246 Front street, New York, are furnishing 110 fire places for 11 fine residences being built by Geo. Edgar at Eighty-ninth street and Eighth avenue, New York.

The Taunton Iron Works Company of Taunton, Mass., are now running their plant four days a week and are meeting with a gratifying demand for their specialties. Among their recent shipments was a large order for Chicago.

Oscar G. Thomas of Taunton, Mass., is running his works four days a week and will increase the time as soon as business will warrant.

The Century Stove Company of Dighton, Mass., have recently resumed operations at their plant after a shut down covering a brief period.

Spence, Baggs & Co. of Martin's Ferry, Ohio, closed their works for a short time during the latter part of February, on account of the scarcity of coke.

The Richmond Stove Company of Norwich, Conn., resumed operations last week with a full force. It is stated on the authority of a local paper that this is the first time in months that the full number of employees has been at work.

The Mechanics' Foundry Company of Rockford, Ill., are busy on the patterns for three sizes of a hot air furnace which they will soon put on the market.

Schill Bros., Crestline, Ohio, owing to the gratifying success which has attended the introduction of the New Idea line of hot air furnaces, first offered the trade in 1892, have been compelled to remodel their present plant in order to obtain better and increased facilities for the production of their goods. The company will, it is said, shortly add a line of steel ranges to their productions which will embody some new and special features.

The Quick Meal Stove Company, St. Louis, Mo., advise us that the pleasant weather prevailing throughout the West during the past two weeks has served to materially increase their business. Among the recent orders secured by them, they note shipments made to Frankfort-on-the-Main, Germany, and a point in Canada.

The Marcy Stove Repair Company, 74 Beekman street, New York, are ready to furnish repairs promptly to the dealer for any stove that he will soon have orders to put in condition for the summer cooking, or the parlor stove that should be repaired before it is stored.

TRADE REPORT.

The Iron Market.

Pig Iron.—In Foundry Iron the movement in the New York market is slow. In New England some pretty good orders are coming up. The lower grades are selling at lower prices than ever in Eastern Pennsylvania. No. 2 is being pressed for sale in this market also. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

A fair demand and unchanged prices are reported from the Philadelphia Pig Iron market. Foundry Irons are comparatively steady at quoted rates, but there is a full supply and no indications of a desire on the part of consumers to make long contracts. If there should be any movement toward higher prices for Coke or Ores, it would doubtless be reflected in stronger prices for Pig Metal, but buyers seem to have no faith in an upward movement in anything, and until it becomes an accomplished fact it is hardly likely that they will abandon the attitude of indifference which they have so long maintained. Ordinary quotations are about as follows for Philadelphia rail deliveries, and from 30¢ to 50¢ less for water, or at points such as York, Harrisburg, &c.:

Standard No. 1 Foundry X	$12.00 to $12.50
Standard No. 2 Foundry X	11.00 to 11.50
No. 2 Plain	10.75 to 11.00
No. 1 Soft	11.50 to 11.75
No. 2 Soft	10.75 to 11.00

A distinct improvement is noted in the demand for local Pig Iron in the Chicago district. Sales have been more numerous and the inquiry is expanding. A noticeable improvement is referred to in the tone of foundrymen in this vicinity. Sales of Southern Coke Iron have also been larger, but are almost entirely confined to Soft brands. Inquiries are good, and better buying seems promised for the immediate future. Lake Superior Charcoal has also sold more largely than for some time, although transactions are still confined to small lots. Quotations are as follows for cash:

Lake Superior Charcoal	$13.00 to $13.50
Local Coke Foundry, No. 1	10.25 to 10.50
Local Coke Foundry, No. 2	9.75 to 10.00
Local Coke Foundry, No. 3	9.50 to 9.75
Local Scotch No. 1	10.25 to 10.50
Ohio Strong Softeners, No. 1	12.50 to 13.00
Southern Silvery, No. 1	11.50 to 11.75
Southern Silvery, No. 2	11.25 to 11.50
Southern Coke, No. 2	10.00 to 10.25
Southern Coke, No. 3	9.50 to 9.75
Southern, No. 1, Soft	10.00 to 10.25
Southern, No. 2, Soft	9.50 to 9.75

In the Pittsburgh market the heavy purchases of Bessemer last week have been followed by a lull, and a light demand is looked for for some time. Foundry Irons continue in very moderate demand. Quotations are given as follows for cash:

No. 1 Foundry	$10.50 to $10.65
No. 2 Foundry	9.65 to 9.75

Beyond the large contracts for Pig Iron placed in the Cincinnati market last week, a fair volume of business is reported, aggregating about 2000 tons per day. Among the buyers have been agricultural implement makers, Stove and general founders, rolling mills, pipe works and manufacturers of specialties such as radiators. Many large contracts for Pipe are pending, and several important contracts have alresdy been placed by Eastern cities at prices even less than were current a year ago, but this fact is justified by the lower prices ruling for Pig Iron. A heavy buying movement of No. 3 Foundry and Soft Irons is anticipated soon, to cover Pipe contracts placed and pending. All in all, there is a more encouraging feeling and a better outlook. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.00 to 9.25
Southern Coke, No. 3	8.50 to 8.75
Ohio Soft Stone Coal, No. 1	14.50 to 15.00
Ohio Soft Stone Coal, No. 2	14.00 to 14.50
Lake Superior Coke, No. 1	11.75 to 12.25
Lake Superior Coke, No. 2	10.75 to 11.50
Hanging Rock Charcoal, No. 1	16.00 to 16.50
Hanging Rock Charcoal, No. 2	15.50 to 16.00
Tennessee Charcoal, No. 1	13.00 to 13.50
Tennessee Charcoal, No. 2	12.00 to 12.50

The St. Louis Pig Iron market is reported as extremely quiet, and sales do not cover anything but small lots. The only sale of consequence during the past week was 600 tons of No. 2 Foundry, sold to a local consumer, the price of which is reported to have been on the basis of $6.60, f.o.b. cars Birmingham. This price is 15¢ ℔ ton less than the ruling price of this grade, and shows how anxious some furnaces are for business. It is only fair to state that other furnaces refused to quote less than $6.75, and of course these prices were not considered. The impression is gaining ground, however, that the weaker furnaces have their order books fairly well filled and will soon cease to be a disturbing factor in the market. The consumption shows a gradual increase, and consumers show no disposition to order shipments withheld. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.00 to $10.25
Southern Coke, No. 2 Foundry	9.50 to 9.75
Southern Coke, No. 3 Foundry	9.00 to 9.25
Southern Car Wheel	16.00 to 16.50

Sales of Pig Iron in the Birmingham, Ala., district are reported as showing a very material improvement; in one instance between 20,000 and 25,000 tons are reported as the sales for the past week. One sale of 10,000 tons this week. The general feeling is that these large sales will stiffen the market, especially if this week indicates a continuance of them. Stocks still show some increase, though the effect of these sales will probably be to reduce them before the end of the month. Demand for prompt shipment is very urgent in some instances, indicating lack of stocks in consumers' hands. Quotations are as follows: No. 1 Foundry, $7.50 @ $8; No. 2 Foundry, $6.75 @ $7; No. 3 Foundry, $6.50; No. 1 Soft, $7; No. 2 Soft, $6.50 @ $6.75.

THE CLEANER MFG. COMPANY of St. Louis, Mo., were chartered last week, with a paid-up capital of $5000, for the purpose of manufacturing and dealing in polishes and cleaners for metals.

Metal Market.

Pig Tin.—During the week wholesale prices advanced 0.10¢ @ 0.15¢ and subsequently receded to about the starting point. The rise was due partly to a measure of confidence brought about by the smaller shipments from the Straits during the last half of February and consequent reduction in the visible supply for Europe and America. The turn downward seemed to have been somewhat in the nature of a natural reaction, assisted more or less by free selling on the part of "bear" operators, who made the most of the opportunity when the market looked strongest, and applied pressure upon "bullish" sentiment moderating. Meanwhile contracts involving considerable Tin, chiefly deliveries from March to July inclusive, were dealt in, and a liberal amount of actual Tin for prompt delivery changed hands, the greater portion of which soon passed into the possession of jobbers and consumers. Apart from the decrease in the visible supply, there is no change in the situation. Stocks here and in London are still quite heavy, and, together with the quantity afloat, assure ample supplies, if, indeed, not a weighty surplus, for some time to come. Straits Pig in small parcels at 14½¢ @ 15¢ ℔ lb. Bars fetch about 1¢ advance on these prices. The consumptive demand continues fair.

Copper.—There has been another fall in prices all along the line, a result of more or less sharp competition for orders. On the decline home consumers have purchased somewhat liberally, but not on a large scale. Some export business has been marked, chiefly for the Continent, but not enough to counteract the natural influence of present heavy output of the mines. Upon the whole, the market may properly be described as unsettled and weak. Jobbing business has been merely of a routine character. The price of small lots of Lake Ingot from store is about 10½¢ ℔ lb. Exports from this country in January, as per Bureau of Statistics returns, were 5290 tons Ingots, Bars, &c., and the equivalent of 1363 tons fine Copper in Matte.

Sheet Copper.—In its general features the market shows no variation from the conditi on noted in our last report. Consumption is still below the average, yet a larger volume of inquiry seems to indicate the existence of a better feeling among buyers. Small lots of Sheet Copper are quoted by jobbers at the net list price, 14¢ ℔ lb.

Pig Lead.—The condition of the wholesale market is practically the same as it was a week ago. No change to speak of has taken place during the interval. Transactions involving more than a few carloads have been strictly the exception, and inquiries have afforded no indica tion of change in the fo rmer policy of consumers under which pu rchases were restricted as much as pos sible to actual needs. Prices are wea kish, although no quotable change has occurred. American Pig in small

lots from store is quoted 3⅞¢ @ 3½¢ ℔ lb.

Spelter.—Small orders have been more numerous than for some time past and have resulted in a very fair business being done. Some improvement is noted in the tone of the market also. Reliable Western brands, in small parcels, are quoted by jobbers at 3¾¢ @ 4¢ ℔ lb from store, but inferior stock can be secured at a shade less.

Antimony.—In jobbing quantities a fair business has been done. For small quantities the ruling quotations are 8¢ for Hallett's and 9¼¢ for Cookson's.

Nickel.—Sellers quote at 35¢ @ 40¢, according to size of lot.

Tin Plate.—Business has been surprisingly light, except for a somewhat spasmodic activity in Cokes for both spot and future delivery, to supply the current needs of can makers. Yet even this class of consumers shows comparatively little interest in purchasing, their demands being still away below the average for the season. The prices at which some of this business has been closed are reported to have been extraordinarily low. The reported suspension of work at various foreign mills and reduced output at others has failed to enliven buying interest in the slightest degree, and does not appear as yet to have curtailed the offering. Nor does the fact of exceptionally low prices seem to offer any inducement to consumers to stock up. These conditions alone serve to keep the market in a remarkable state of weakness, and, in addition, where necessary to retain or secure custom, American manufacturers have met foreign prices, thus adding to the demoralization of the market. In some instances, it is said, prices made on American Plates have been actually lower than those quoted for foreign stock of like character. In other cases, imported Plates are reported to have been sold at a lower price than the lowest at which they could be imported. March has not so far shown any ground for solid encouragement to the Tin Plate trade at large.

The condition of the British Tin Plate market is thus described in a special London cable dispatch of March 5 to *The Iron Age:* Tin Plate is unchanged. Limits from America check business, being very low. Board controlling 391 mills held a meeting on Thursday, and decided to decrease the make by one-third at each mill. The Ashburnham works have restarted. Stocks at shipping point about 247,000 boxes, in the face of further decrease in mills. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20	9/	@	.....
Siemens Cokes, IC 14 x 20	9/3	@	9/4½
Ternes, 20 x 28	18/	@	23/
Charcoals, IC 14 x 20	10/6	@	13/

Sheet Iron.—The volume of business in both Black and Galvanized Sheets has increased considerably and some large orders have been placed with mills up to July 1. Jobbers' quotations for small lots of No. 27 Common Iron from store rule at about 2.65¢. Galvanized Sheets in similar quantities are quoted at the discount of 75 and 5 % @ 75 and 10 % off.

Chicago Report.

Scrap.—Wrought Scrap of best grades has been in fair demand, but cheap qualities are neglected. Cast is in light supply with a good inquiry. Heavy Steel Scrap is doing well. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$6.50	....
Machinery Cast	5.50	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....

CONDITION OF THE

Hardware Trade.

WITH THE OPENING of spring, according to the calendar, and the advance of the season and the coming of more moderate and warmer weather, there is a quickening in trade and a more active preparation for the business which is expected during the next few months. Seasonable goods are in especial demand, and there is on the whole little complaint to be made in regard to the volume of trade in this line. There are also indications that in Builders' Hardware trade will be at least fair, but with the large production of goods there is much competition for such orders as are going. Carpenters' and Mechanics' Tools are receiving their share of attention, and it is thought that business in this class of goods will be better than last year, but in some of them prices, though confessedly very low, are more or less irregular. In heavy goods, on the other hand, there is a slightly firmer feeling, and in some cases extreme figures have been withdrawn. The trade are anxiously awaiting the time when there will be satisfactory indications of a general stiffening in the market, but as yet this is not the case. Merchants are taking the view that careful buying is the correct policy and are placing their orders for only such goods as are necessary, and manufacturers are called upon by their larger and smaller customers to carry stocks from which goods can promptly be furnished on rush orders. At the same time manufacturers are endeavoring to avoid undue accumulation of stock on account of their past experience in connection with the decline of prices. It is probable, therefore, that the stocks of goods in the hands of both manufacturers and jobbers are considerably lighter than usual.

Advices from Chicago.—Better weather has rejoiced the hearts of Shelf Hardware jobbers, as it has brought with it a largely increased demand for goods. A strong symptom of the better condition of trade throughout the country is shown in the recent buying of new stocks. Quite a number of new Hardware firms have made arrangements to start at various points in the West, and have bought stocks in this jobbing center during the past two weeks. Regular demand from the trade also appears to be more general, covering almost all lines of goods, showing that the country is extremely bare of stocks. Those ordering in small quantities are usually the most clamorous for prompt shipments. The only kind of goods now neglected is Builders' Hardware, but the building season has not opened throughout the country. This branch of trade may be expected to continue dull for some time to come. The demand for Tinware has fallen off considerably, although within the past day or two orders again showed a tendency to increase. Collections have recently been somewhat better.

Notes on Prices.

Wire Nails.—A fair but not especially heavy volume of business is being done by the manufacturers, who are, however, well supplied with orders and refer to the situation as satisfactory, with indications of a good steady business during the season. Their prices are firmly maintained. The prices at which a few jobbing houses are offering Nails purchased before the recent advance have apparently had comparatively little effect on the market as a whole, the trade understanding pretty well the circumstances which induce this cutting in prices.

Advices from Chicago.—Manufacturers almost invariably report a quiet week, but as they are well fixed for orders they are not anxious about the situation, especially as stocks are moving a little better from the hands of jobbers, who are enjoying a much better trade. The same irregularity in their prices continues as previously reported. Quotations range from 95 cents to $1.05, Chicago, yet those who are making the outside figures report an excellent movement in small lots, which is fully as large as in previous seasons.

Cut Nails.—There is little new in the Cut Nail market. Prices for small lots from store are steadily held at 85 to 90 cents. The volume of business is comparatively small.

Advices from Chicago.—Manufacturers report trade still quiet. Jobbers quote small lots from stock at $1.

Barb Wire.—An improved demand is reported for Barb Wire and the manufacturers refer to the situation as on the whole a very satisfactory one. Prices are well maintained by the manufacturers on the basis of $1.90 for carload lots of Four-Point Galvanized at mill. Some leading jobbers continue, however, to undersell the manufacturers, thus producing some irregularity

in current prices. The general tone of the market is, however, well maintained. Small lots from stock in New York are quoted at $1.65 for the Painted and $2 for the Galvanized.

Advices from Chicago.—The time is now close at hand when the jobbing trade of the West and Northwest must buy actively. So far they have purchased sparingly, but the advent of March means a different condition of trade. Farmers will be able very speedily to resume outdoor work. Manufacturers have been able so far to avoid much accumulation of stock, owing to the orders taken in December and January. They are confident that from the present outlook the month of March will see them running to their full capacity, and unable to make prompt shipments. Small lots from stock are moving a little more freely at $1.65 for Painted and $2 for Galvanized.

The Yankee Sprinkler.—Cleveland Lock Company, Cleveland, Ohio, manufacturers of the Yankee Sprinkler, which was illustrated in our issue March 2, are selling it to the trade at $4.25 per dozen, japanned, and $4.50 per dozen, galvanized, complete with washer and 20 feet of cotton cord, one Sprinkler in a box.

Mop Wringer.—The T. I. C. Mop Wringer, illustrated in *The Metal Worker* of the 16th ult., and put on the market by the Torrance Iron Company, Troy, N. Y., is sold to the trade at $5 per dozen, a discount of 10 per cent. being allowed on orders of one gross and over.

S. & W. Drilling Attachment.—The Smith & Winchester Company, Boston, Mass., are putting on the market the S. & W. Drilling Attachment for drilling metals. The drills are made in two styles, for use with round and square shank drills. The former style, A, is sold at $1.75, and the latter style, B, is sold at $2.50 apiece.

Cordage.—There is but little change in the prices ruling for Cordage, but something of an increased demand is perceptible. Quotations for large lots, f.o.b. factory or New York, are as follows, subject to a discount of 1½ per cent. for cash:

	Cents.
Manila, base	7 to 7¼
Sisal, base	4 to 7¼
New Zealand, base	4 to 7¼

Red Lead.—About the average sales of domestic have been made and the market remains steady, being free from serious disturbing influences. Foreign has remained quiet, with buyers showing no interest except in small lots for immediate delivery. Prices have undergone no change.

White Lead.—Distribution of dry White Lead in small quantities has increased somewhat, and there has been a much freer trade in Lead in Oil also. Prices generally have remained stationary, but indirect concessions are made by jobbers where such inducements tend to help the sale of other of their goods. Competition is keen.

Screws.—The Screw market, as the trade are aware, has for some time been in a somewhat unsettled condition, the manufacturers' printed discounts not representing at all closely the prices at which the goods have been selling. In order to correct this condition of things discount sheets have been issued by American Screw Company and Russell & Erwin Mfg. Company, under date of March 1, naming a discount of 87½ and 10 per cent. on Flat Head Iron Screws, with corresponding changes in the prices of other leading kinds. The present discounts on Screws are accordingly as follows:

	Per cent.
Iron, Bright, Flat Head	87½ and 10
" " Round and Oval Head	82½ and 10
" Blued, Flat Head (add 5 per cent. to net amount of invoice)	87½ and 10

Brass, Nickel Plated, Round Head, burnished	66⅔
Copper, Flat Head	65
" Round Head	60
Bronze, Flat Head	82½ and 10
" Round Head	80 and 10
Phosphor Bronze, Flat Head	60
" " Round Head	55

In their discount sheet announcing the above prices the American Screw Company, Providence, R. I., also quote a discount of 87½ per cent. on their Rogers' Drive Screws, and give their present prices on Machine Screws, Bolts, Rivets and miscellaneous goods, and the Russell & Erwin Mfg. Company, New Britain, Conn., and New York in announcing the above prices, give the following discounts on their Diamond Point Steel Screws:

	Per cent.
Oval Head	87½ and 10 and 10
Flat Head	87½ and 10
Round Head	82½ and 10

They also give lists and discounts applying to Stove Bolts, Sleigh Shoe Bolts, Steel Wire Nails, Steel Wire Brads, Steel Wire Carpet Nails, Brass Escutcheon Pins, &c.

A. L. Swett Iron Works.—The following are the present prices of the goods manufactured by the A. L. Swett Iron Works, Medina, N. Y., the discounts applying to the lists given in their recent catalogue:

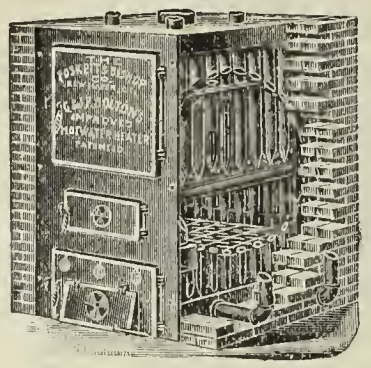
Capital.

It is a consolation for all right minded young men in this country that though they might not be able to command as much pecuniary capital as they wish, to commence business themselves, yet there is a moral capital which they can have which will weigh as much as money with those people whose opinion is worth having. And it does not take a great while to accumulate a respectable amount of this capital. It consists in truth, honesty and integrity, to which may be added decision, courage, perseverance. With these qualities there are few obstacles which cannot be overcome. Friends spring up and surround such a young man as if by magic. Confidence flows out to him, and business accumulates on his hands faster than he can ask it. And in a few short years such a young man is far in advance of many who started with him having equal talents and larger pecuniary means; ere long our young friend stands foremost, the honored, trusted and loved. Would that we could induce every youthful reader to commence life on the principle that moral capital is the thing after all.—*West Jersey Press.*

— BREAKING IT GENTLY: "Really, Mr. Stalate," she protested, "you have given me four hours of your time this evening."

"Why—er—upon my word! So I have. The hours pass like minutes when I am with you."



"You were telling me that since your promotion your time is valuable."

"Yes,"

"Well, papa doesn't allow me to accept expensive presents from young men."—*Washington Star.*

Your Correct Weight

The person who may have been congratulating himself upon a gain of several pounds in weight over a given period may not be pleased to learn, says an exchange, that Dr. Henri de Parrville finds this idea to be probably an illusion. This French investigator has satisfied himself by a five years' record of precise daily weighings of his own body that very few persons have any accurate knowledge of their own weight. In ordinary weighings no account is taken of the errors of the scales, of the weight of the clothing, of the time after eating, of the condition of the body as regards heating, or of the barometric or hygrometric state of the atmosphere. Discarding sources of error, the actual weight is constantly changing, being subject to innumerable influences. After breakfast, on a warm day, one loses more than a third of a pound an hour, and, as 70 per cent. of the body is water, our weight must constantly vary with the transpiration of moisture. It varies, moreover, with the pressure of the atmosphere. The mere variations in atmospheric humidity may account for a change of more than a pound, and other causes may account for another pound. For these reasons, the usual inference of a gain or loss of a few pounds in a considerable interval is to be distrusted. Accurate scales, however, are not without value in medical practice, lack of a certain definite growth indicating impaired health in young infants, while in adults a sudden increase of a pound or so in a day denotes a tendency to disease, and fluctuations of not more than three or four ounces per day are evidence of health.

— THE NEW WOMAN'S ARRIVAL —Miss Fan De Syckle: "Who was it said, 'The hand that rocks the cradle is the hand that rules the world?'"

Mrs. Strongmind: "I don't know. But, anyway, no one pays any attention to anything said of the men nowadays."—*Puck.*

— MARRIED MAN: "Why don't you get married, Miss Perkins? You are getting to look like a 'back number'—you will soon be an old maid."

Miss Perkins: "If I were as easy to please as your wife was, I would have been married long ago."—*Boston Home Journal.*

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper in all Forms.

By JOHN FULLER, Sr.

327 Pages, 474 Illustrations, 7 x 10 inches, Cloth. Price, $3.00.

This work, prepared at great labor and expense, is reproduced from *The Metal Worker*, and forms an exhaustive treatise on the Coppersmiths' Art, being the only volume on that subject that has been published. It is beautifully illustrated with 474 pen and ink drawings, and is bound and printed in the best manner.

CONTENTS:

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea-Kettles; Oval Tea-Kettles; Beer Mullers; Funnels; Coffee Pots; Sauce pans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set fo Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

ROYAL

WASH BOILER HANDLE.

PATENTED.

We call the trade's special attention to the Royal Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.

The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

PAYNE'S BUSINESS EDUCATOR,

600 pages, bound in cloth, $2.

Every business man should have some knowledge of the State and general laws of the country, especially those affecting the collection of accounts, rates of interest, &c. He should be able to draw up many of the simpler papers, such as leases, contracts, &c. He should be familiar with the different forms of legal papers used in business, and, above all, he should be an easy and pleasant letter-writer. All these points are carefully treated in Payne's Business Educator.

Among the subjects specially discussed are:

Commercial Correspondence.—Over 150 models of letters are given, covering every phase of business correspondence.

Legal Forms Used in Business.—Articles of copartnership; notice of dissolution, form of assignment; short form of deed; bill of sale; power of attorney; lease; surety; will; notes—promissory, negotiable, non-negotiable and demand; exchange—inland and foreign; acceptance; due bill; receipt; bills of lading; private cost marks, &c.

Dictionary of Mercantile Terms.—Giving a full and clear explanation of terms used in business.

Titles.—Official, military, scholastic, naval and professional titles used in the United States.

Useful Hints for Measuring Land.

Legal Rates of Interest, foreign coin, weights and measures compared with American standards.

Rules for Punctuation.

Rules of Order for deliberative assemblies and debating societies.

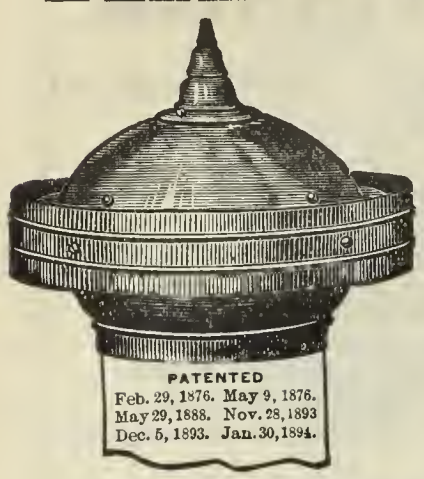
Interest Tables, and tables of weight and measures, &c.

How to Use a Typewriter, with lessons for practice.

Exercise in Practical Penmanship.

Laws and Forms.—An epitome of the laws of the United States and of the different States of the Union, which will be found invaluable to those who are forced to appeal to the law, as well as to that large class who wish to avoid it. The whole is alphabetically arranged, so as to make reference easy. Forms are given for a great number of legal papers, &c.

Dictionary of synonyms; marks of account; list of abbreviations; French, Spanish, Latin and Italian words and phrases, &c



Making in all the most complete self-educator published.

SECOND EDITION.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

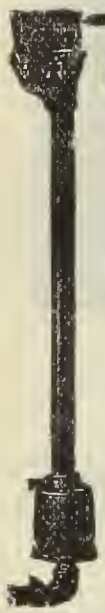
WITH THIRTY-FIVE ILLUSTRATIONS.

48 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.



Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

"Salvage Closet Connection."

For Repairing Earthenware Closets of all kinds when the Flush or Revent Horn is broken off. It will **SAVE THE CLOSET AND MAKE IT BETTER THAN NEW.**

It is SIMPLE and PRACTICAL, Easily Adjusted and RELIABLE.

It can be attached without removing the bowl. It has the "standard thread" and can be put in place, if only a part of the "Horn" is broken off, without the necessity of having the balance of it smooth.

Patent Applied For.

A trial will convince you of the superiority of this over any other connection made for this purpose. Write for circulars and prices.

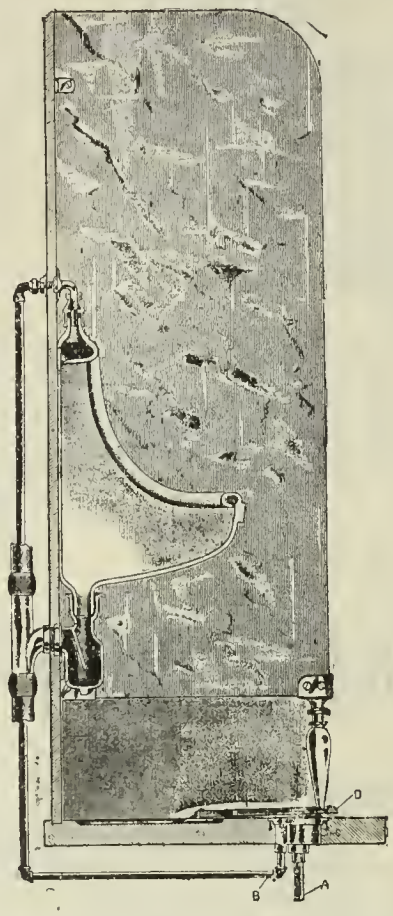
THE KELLY

Self-Acting Frost-Proof, After-Flush Closet.

For Extreme Cold Places and Out of Door Work.

When the seat is occupied the tank fills, when vacated the water in the tank discharges into the closet. The pipe and valve drain into the trap, as shown, leaving no water above freezing point, it matters not at what height above the seat the tank is placed.

—SEND FOR CATALOGUE.—



Thomas Kelly & Bro.,

124 Franklin St., Chicago,

Manufacturers of Permanent Plumbing Goods.

AUTOMATIC FLUSHING VALVE FOR URINALS.

OPERATED BY TREADLE.

This is the neatest and most economical method yet designed for the purpose. Urinals flushed by this method will be cleaner and freer from stoppage than those flushed by any other system, and less water consumed in doing it, for the simple reason that the flush only occurs when the urinal is in use.

The operating valve has a flange on its upper end for bolting to the floor, and which is let into the floor slab, thus presenting a smooth flush surface which can be easily washed. The top of the valve is arranged with a cap; by unscrewing this all the working parts, including the seat, can be taken out for repairs when necessary, thus leaving nothing but the main supply "A" the supply to Urinal "B," and the Valve Chamber "C," either in or under the floor, and these parts may be considered almost imperishable.

The treadle "D" is Cast Iron, galvanized (also furnished in brass), one end of which is fastened to the floor slab by brass bearings which permit of its being thrown back for the purpose of cleaning under it. The other end rests on the valve spindle.

When a person stands on the treadle (and he cannot get at the urinal unless he does), the flush begins and continues until he leaves it, when the valve closes automatically. By this method the flushing water is delivered at the time it is most required, and is, therefore, unlike the periodical flushing tank, which is delivering water regardless of whether the urinal is in use or not, and so wasting water.

THE IRWIN & REBER
PATENT
EXPANDING WATER CONDUCTOR.
MANUFACTURED BY THE
S. S. S. Conductor Co.
LIMITED,
163 Lacock Street,
ALLEGHENY, PA.

THE STANDING SEAM allows of an easy and secure fastening, keeping the pipe far enough from the wall to make any overflow from the eave pipe or head, run down the spout, and not the wall; and will open, in case of freezing, so as to prevent bursting, and still remain double-locked and water-tight.

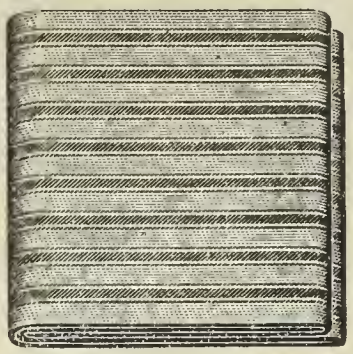
Made in 6-foot lengths of a single sheet of SOFT STEEL.

GALVANIZED, KALAMEINED or LEADED.

The Irwin & Reber Expanding Water Conductor Pipe has been extensively used through the United States and Canada for the past ten years and has proved itself to be the best in the market. Send for Price-List.

The Climax Ratchet Stock

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.



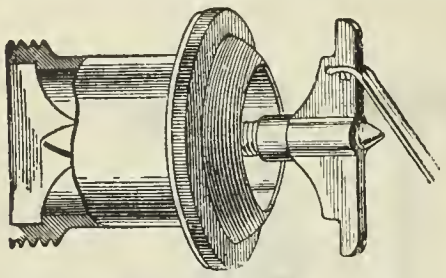
No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

For sale by leading jobbers.

Manufactured Solely By

C. M. KEMP MFG. CO.,
Baltimore.



"Columbia" Wiping Cloths FREE!

Not free exactly from a financial standpoint (altho' very near it), but free from all defects due to a **Poor Quality of Ticking, Carelessness in Making and a Bungling Manner of Fastening the Ends.** A cloth free from the above defects is well worth the price we ask, 12 cents each, or six for 70 cents. Remember we make any kind—send us the size you want, giving the wiping edge first.

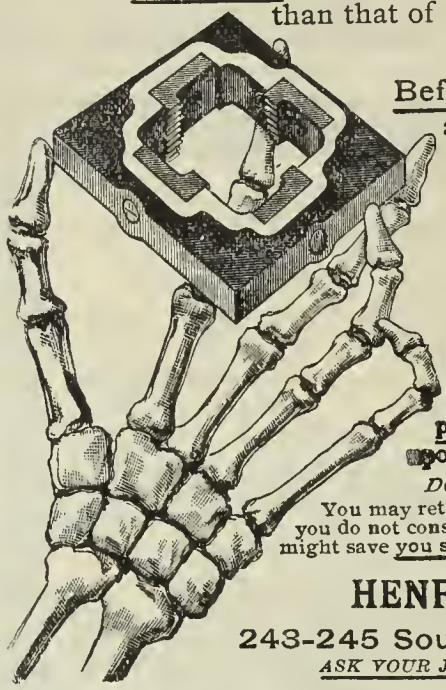
E. T. HANGER. PATENTED.

TINNER, ATTENTION!



The cross-bar is hooked firmly to both sides of the trough. The slotted upright, with thumb-screw, permits instant adjustment to the requisite fall. It is never necessary to bend the suspending rod to suit pitch of roof. No obstructions to catch leaves and dirt, as in other adjustable hangers. **Save Time and Money.** Sample order freight allowed. For sale by first-class Jobbers. Manufactured by
JOHN SEVERDING, - - Richmond, Ind.

Maule's "Skeleton" Pipe Die

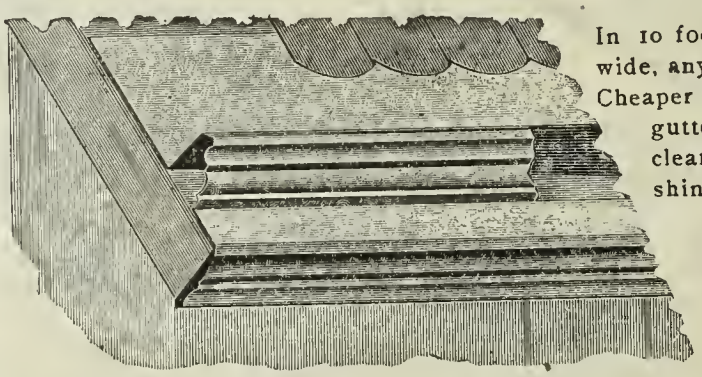
Two "Points" about it—only 2 (There are plenty more, but we only mention these two here.)

1

The First Cost to you of MAULE'S "SKELETON" PIPE DIE is less than that of any other Pipe-Threading Die—and

2

Before it becomes dull from use it will cut as many perfect threads as the best solid die extant, and when it is dull, you don't throw it away and buy a new one—Oh, no! You simply sharpen the cutters on a common grindstone, and so make it practically as good as it was at first, and this sharpening process may be repeated a number of times.



A sample One-inch "Skeleton" Pipe Die either 2⅜ or 2½ x ¾ thick, by mail, postage prepaid, will cost you 62 cents, and will be sent upon receipt of a Postal note for that amount.

DO NOT SEND US ANY POSTAGE STAMPS.

You may return such sample to us, at our expense, if, after seeing it, you do not consider it worth the price. Don't the above sound as if it might save you some money—if TRUE?

PALM OIL

BRANDS:

"Cecelia" Clarified Palm,
"Lagos" Palm,
"Choice Red" Palm,
"Brown" Palm.

☞ "Cecelia" Clarified Palm Oil is prepared by us especially for Tin Plate Manufacturers, and is clarified in order to remove moisture grit, and free acid to the minimum, thus making it the safest and surest oil to use.

LAMBERT STOUGHTON & COOPER,

IMPORTERS AND PRESSERS OF OIL,

117 Walnut St., PHILADELPHIA, PA

— "When I grow up," said a little six-year old philosopher, "shan't I feel strange for a day or two?"

— The fool seeketh to pluck the fly from the mule's hind leg, but the wise man letteth the job to the lowest bidder. —*Exchange.*

The Gulf's Level Rising.

According to the engineers of the Hydrographic Bureau, the level of the Gulf of Mexico is 1 foot higher than it was in 1859, and, of course, the encroachment on the surrounding coasts has been greater or less, depending on their character. In some places, where the marginal lands are composed of high, rocky bluffs, this change of level has gone on from year to year without attracting attention. On the other hand, many low lying points (some that were once inhabited by the primitive inhabitants or by the pioneer white settlers) are entirely submerged. The cause of this change of level, says the St. Louis *Republic*, has not as yet been ascertained, but it is reasonably certain that it is the result of either a settling of the dry land or of a general and uniform rising or upheaval in the Gulf bed. No man who has given the matter a moment's thought will argue that there is more water in the Gulf now than there was 35 years ago. On the contrary, there isn't the least doubt but that there is much less. However this may be, if this aqueous encroachment is steadily maintained, Keokuk will be a deep water harbor and St. Louis and the whole Missouri will be entirely submerged in less than 40,000 years from January 1, 1895.

— The Gas Log Pretense —There is one modern convenience against which draw the line, and that is a fire place furnished with gas logs. You may sit in front of gas logs for a week and let them flame and flutter as they will and never get a spark of inspiration out of them.

"And why?" you ask. "Do they not burn gayly and show many colored flames, and are not the real logs so cunningly imitated that they might deceive a wood chopper?" "Yes," I reply, "this is true enough; but their flame is too mechanical; their logs give out no odor of the woods."

The fascination of a wood fire is that it burns by fits and starts; one flame shoots far up the chimney, the next reaches out but a few inches, and then they may all die out. That you can strike the logs with the tongs and break the flames into myriads of sparks is still another attraction. Fancy the odor if, in a fit of absent mindedness, you struck a burning gas log hard enough to break it.

I can reconcile myself to a steam radiator, because it makes no pretensions. It stands in all its gilded hideousness and throws out heat. It does not try to make you think that it is as beautiful as burning logs. It has its own place (usually the most conspicuous in the room), but it does not usurp the throne of the moss covered log.—*The Critic.*

His Leg.—There are not many men who can allow a heavy locomotive to run over one of their legs and afterward walk away uninjured, but George Munden, who claims a home in New York City, is such a man. Munden was crossing the tracks of the Reading Railroad at Allegheny avenue recently when a shifting engine, bowling along at a fair rate of speed, struck him and ran over his left leg. The engineer stopped his locomotive as quickly as possible, and he and the fireman ran back to pick up the man, whom they expected to find, at least, badly injured. They were considerably startled to see the supposed injured man limping toward them along the track.

"Are you the fellow we ran over?" asked the engineer.

"No," said Munden, "you ran over my leg."

"Well," said the engineerwith surprise, "that's part of you."

"Not exactly," said the other, "it's wooden."—*Philadelphia Record.*

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is one of the best and most practical systems for producing elbow patterns, for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow no matter of what diameter, number of pieces, or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

DAVID WILLIAMS.

PUBLISHER and BOOKSELLER,

96-102 Reade Street, - New York.

— A GREAT MAN.—The resident was showing the visitor the sights of the town, when they passed a distinguished looking citizen.

"Did you notice that man we just passed?" asked the resident.

"That fine looking one?"

"Yes. Well, he can draw his check for a million dollars."

The visitor turned around to get a better look at such a rarity.

"Can he get it cashed?" he asked quietly, and the resident appeared to feel hurt.—*Detroit Free Press.*

— A MAN on Third street, who has an impediment in his speech, was heard saying: "B b-b-boy, kick kick-kick call that p-p-pup off! D d-d-do you h-h-hear me?"

"Dere ain't no pup, mister. E's grown into a dog since you began talking."—*Louisville Gem.*

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstrat on is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

DEEP THROAT.
(15 Inch)

PUNCH.

Double Action.

Strong, easy of operation, cheap. Will punch ¼ inch hole through No. 10 iron or steel and lighter.

GEO. C. KEENE & CO.,
Mfrs The Keene Brake
CINCINNATI, - OHIO.

PRESSES, DIES AND TOOLS
For Can and Tinware Manufacturers.
Dies for Cutting, Drawing & Stamping Tinware
Estimates given at sight of samples of drawing work.
Send Sample for Prices before ordering elsewhere.
DOVER MACHINE WKS, Dover, Del.

THE ENGLISH AND AMERICAN MECHANIC:

An Every-day Hand-Book for the Workshop and the Factory.

CONTAINING

SEVERAL THOUSAND RECEIPTS, RULES AND TABLES INDISPENSABLE TO THE MECHANIC, THE ARTISAN AND THE MANUFACTURER.

By VAN CLEVE and EDWARDS.
500 Pages, Cloth, $2.00.
Sent, postpaid, upon receipt of price, by
DAVID WILLIAMS, 96-102 Reade St. N.Y.

CLASSIFIED LIST OF ADVERTISERS.

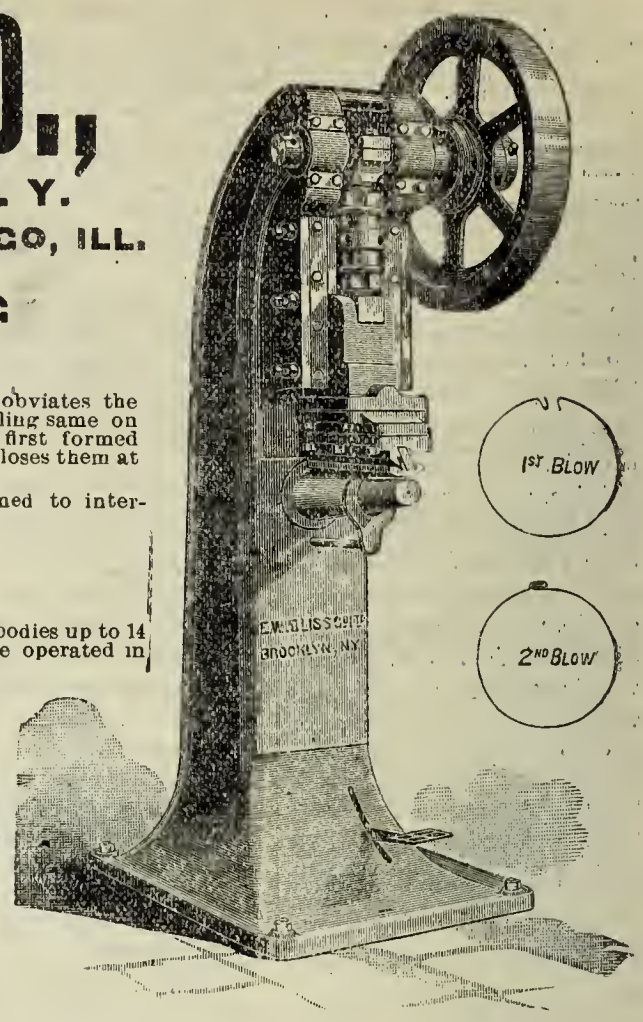
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



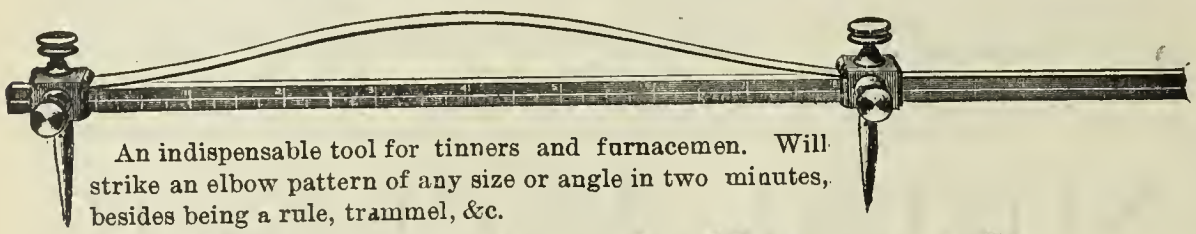
First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.



PRESSES, PUNCHES, SHEARS,

DROP HAMMERS,

DIES, SPECIAL MACHINERY &c.

THE STILES & PARKER PRESS CO.

An indispensable tool for tinners and furnacemen. Will strike an elbow pattern of any size or angle in two minutes, besides being a rule, trammel, &c.

These goods will set your trade in motion this spring and keep it going indefinitely.

See Description on Opposite Page.

ISAAC A. SHEPPARD & CO., { PHILADELPHIA, PA. / BALTIMORE, MD.

MANUFACTURERS.

Admirable Trade Accelerators!

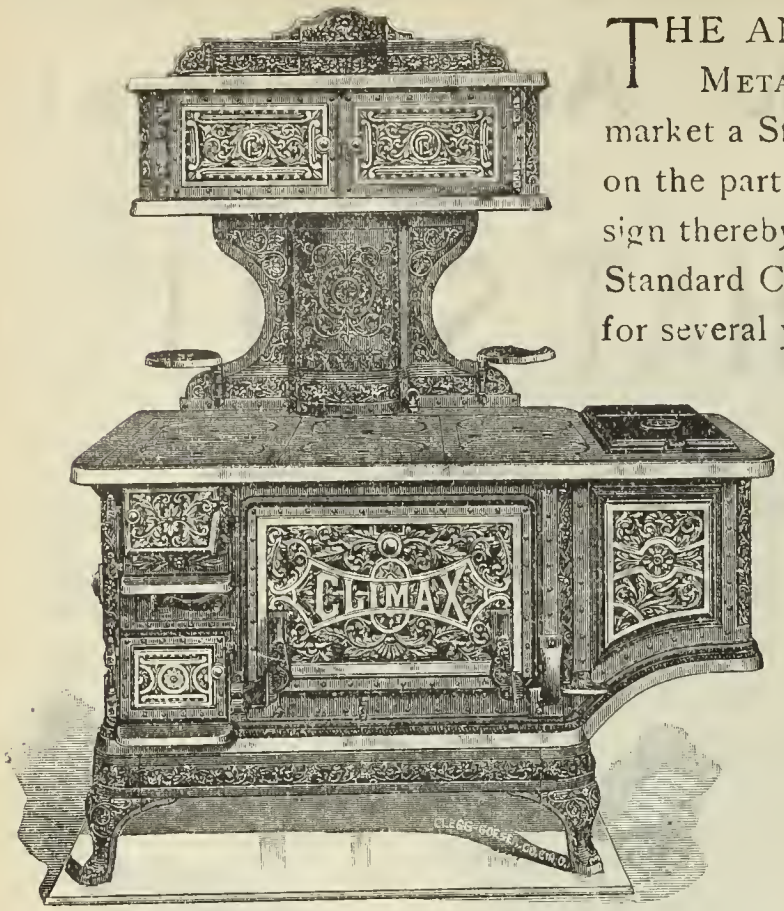
RANGES THAT SELL!

To sell goods now-a-days they must fairly bristle with good points. When Mrs. Noah moved out of the ark and set up housekeeping on Mount Ararat, she might have been satisfied to bale out hot water from an encased reservoir with a dipper (always spilling some on the stove top, of course), but modern housekeepers prefer to draw it off through a spigot, as those who use the **ROYAL EXCELSIOR RANGES** do. (This is our own patent. That is why you don't find other manufacturers using it.) Then there is also our "**ECLIPSE COVER,**" Three points: 1. Shape makes it strong—no place in it for a crack to start. 2. Cover lifted *at center of gravity,* the easiest possible way to lift a weight. 3. Cover lifted at once *from any position*—no pulling or pushing it around to bring lifter hole toward the operator.

Eclipse Cover.

Patented December 29, 189 .

Damper easily replaced through pipe collar, having no rods to warp or burn out. Large end Hearth, sliding forward. Deep, roomy Ash Pit, Bailed Ash Pan, &c. Fire Box fitted for Wood, or Hard Coal, or Soft Coal, as desired. Grates quickly removed without disturbing Fire Box Linings. Cross pieces so arranged as to bring four boiler holes directly into contact with the fire. Water Fronts for all sizes, with connections taken from the back to either right or left of range, so that circulating boiler may be used on either side. The Feet are independent of the Skirt Base, which bolts to the feet after the Range is set up, thereby enabling one man to put the entire apparatus in place. The design is the work of a superior artist. All edges are beautifully ornamented, and will look well as long as the range lasts (Ground edges are hard to keep from rusting while goods are in stock, and turn blue and lose their good looks at the first fire. The ornamented edge is one of the greatest improvements of modern stove making.)



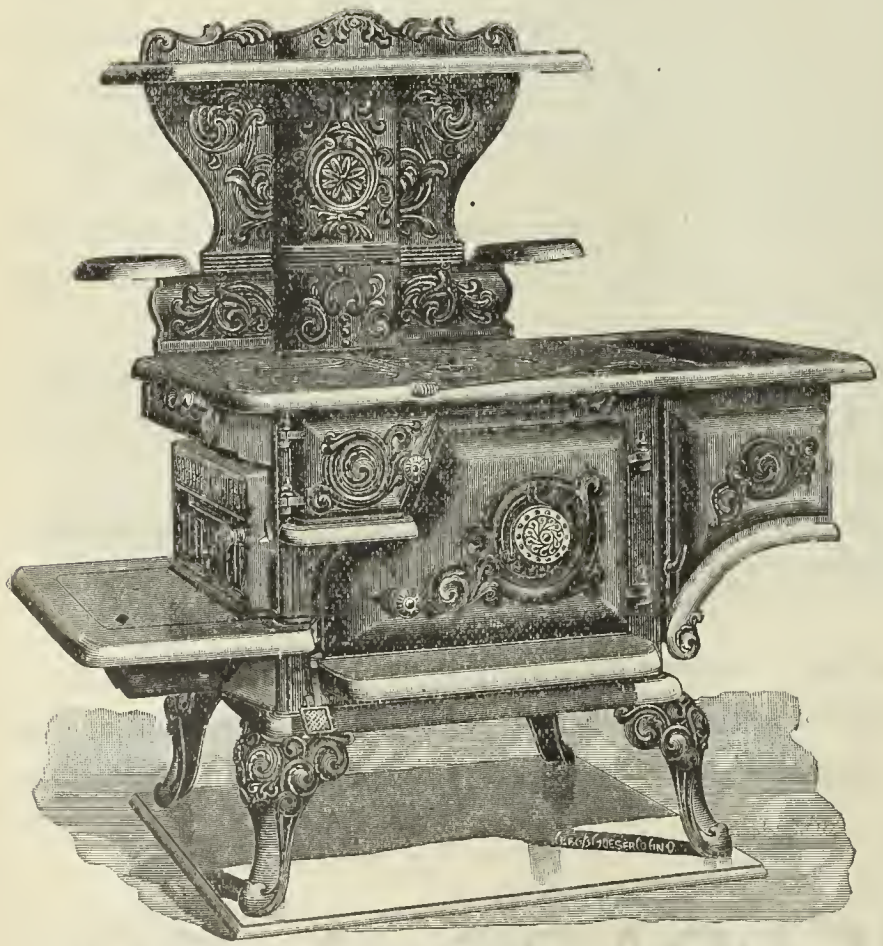
The mounting and fitting are of the best, and the added features of Nickeled "Alaska" Knobs, Nickel Name Plate, Nickel Oven Door Panel with Tile Center, Nickel Hinge Pins and Nickel Oven Door Pedal enhance the attractiveness of the goods

We cannot tell you all about these goods in a moment. Send to us for a descriptive and fully illustrated catalogue-circular. They are made with either four holes or six holes on top and with or without Reservoir.

If you buy one of these ranges, blacken it nicely and put it in a conspicuous place on your store floor, and within 30 days you are not satisfied with it, you may send it back at our expense. (If you keep it over 30 days, of course it's a sale.) Does this proposition strike you as fair?

ISAAC A. SHEPPARD & CO.,

Philadelphia and Baltimore.



THE ANNOUNCEMENT in a recent issue of THE METAL WORKER that we are soon to place on the market a Steel Climax Range having prompted the inquiry on the part of some of our patrons as to whether we design thereby to abandon the manufacture of our Celebrated Standard Climax Range, which has maintained supremacy for several years as an established leader of its class and against which not a single complaint has been filed in our office, we desire by this to inform the trade that the reputation of the Climax Range and constantly increasing demands for same is such as to preclude the possibility of abandonment if we felt disposed to do so. The Range, we are pleased to say, is more popular than ever, and the manufacture of same will be continued in all its varied conventional styles and sizes, and we sincerely trust that none will be deceived into a belief that an ***imitation*** now being offered to the trade is as good as the initial construction, which can only be procured of

"JUST AS GOOD AS THE AKRON 'AIR BLAST' FURNACE,"

AKRON AIR BLAST FURNACE.

MAY & FIEBEGER AKRON, OHIO.

Has become a familiar expression with the stove trade in many States.

Don't **you** want to make your competitors use it? Why it is so commonly used, is a Think to thought about.

WE ARE IN IT.

The past extremely cold weather has clearly demonstrated that.

THE ORIGINAL AKRON AIR BLAST FURNACE and its many agents are strictly in the swim. There is no weather too cold for us.

After twenty-five years' experience with the best furnaces made our Mr. May was convinced by careful experimenting and studying that they were not built on scientific principles, and therefore he invented and six years ago perfected the "Air Blast" principle for burning coal, which he has applied to the Akron Air Blast Furnace, and it has been so successful in burning all kinds of fuel, especially soft coal, that it has completely revolutionized the furnace business, and all manufacturers of the best furnaces are now trying to imitate it. The Akron Air Blast Furnace is the original and leader. Others follow.

THOUSANDS of users are glad to testify to its merits and its economy.

HUNDREDS of dealers are happy with its success.

DOZENS of imitators are wondering how it took its place at the front in so short a space of time.

ONE special dealer we are desirous of informing as to why the Akron Air Blast Furnace has such a wonderful record. You we mean. Write us.

Build up your trade with a certainty. No need of making furnace work a hit and miss.

Can you equal the following record with the furnace you are selling?

We have hundreds of agents in Ohio, Indiana, Illinois, Iowa and other States whose experience is equal to this. Carload and duplicate orders from them prove that their trade is increasing.

76 Furnaces Sold

AND NOT ONE COMPLAINT.

THE

Akron "Air Blast" Furnace

Has proven a Record Breaker. Even in hard times our agents have been busy. You should secure agency at once and be in the race at the front.

READ THE FOLLOWING LETTER:

OFFICE OF
WELCH & HORTON,

NEW CASTLE, Pa., March 23, 1891.

Messrs. May & Fiebeger, Akron, Ohio.

GENTLEMEN: We took the agency of the Akron Air Blast Furnace late in the season of 1891, and have sold up to the present time 76 Furnaces, and have not had a complaint from a single furnace, which we consider is the best recommendation the furnace can have. Our furnace trade has been affected less by the hard times than any other line of goods we handle, which shows that people always find the means with which to buy a good article.

The Akron Air Blast Furnace has established a reputation for itself through Lawrence County that other furnaces cannot overcome, and when they make a sale it is to parties who look at price and not the furnace. We know that we have the best furnace on the market to-day and our customers know it, too. Wishing you success for 1891, we remain, Yours respectfully

WELCH & HORTON.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth, Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

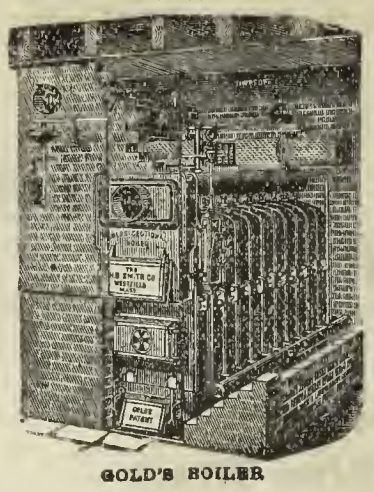
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9⅛ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

HAMILTON'S

BEST REDIPPED AMERICAN ROOFING TIN

is DIPPED AND REDIPPED by HAND, and is NOT coated b machines through ROLLS like some plates that are laude so highly by the makers. and the coating on Hamilton' Best Redipped is as heavy on the TOP half of the sheet a it is on the BOTTOM half. You have scales, test it. We ca furnish machine coated plates with 20 lbs. of coating t the box of I. C. 20 x 28 at $11.50 per box, fully equal t any of the so-called extra coated plates.

JOHN HAMILTON,

PITTSBURGH, PA.

McCLURE'S REDIPPED

ROOFING TIN.

AMERICAN MADE.

The durability of a Roofing Plate is in the amount and quality of Coating and not in the iron.

McCLURE'S REDIPPED

Is the finest and heaviest coated Roofing Plate made; guaranteed to contain **35 lbs. Coating** per 112 sheets.

To reduce the price of a Roofing Plate is simply to reduce the quality and amount of coating, thereby making a much inferior plate.

The high quality of **McClure's Redipped** will always he maintained as it is our desire to make the **finest and heaviest coated** Roofing Plate in the market regardless of any cost.

The best is always the cheapest.

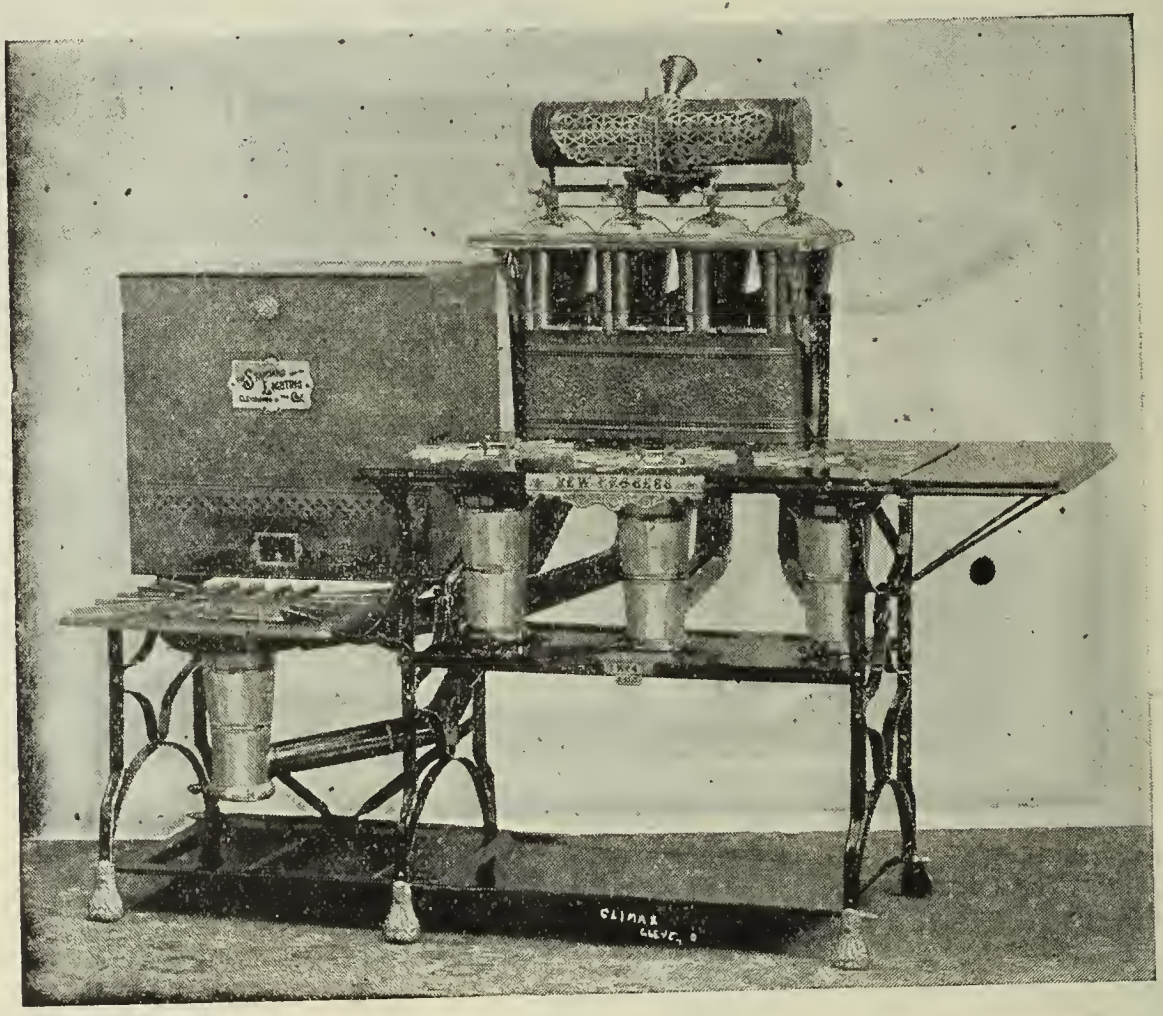
THE "NEW CHARTER OAK."

IT'S A BEAUTY AND A SELLER.

YES, "there are others," and they are *all about alike*, differing practically only in name and ornamentation, but there is only one

CHARTER OAK,



the only specialty in stoves. The best, the handsomest and most profitable for dealer and consumer.

THOSE of your customers who know a GOOD THING when they see and try it, can enjoy the benefits arising from the use of the **WIRE GAUZE DOOR** when they buy this stove. While those who do not appreciate the advantages of admitting fresh air into the oven can also be satisfied, for it is arranged that it can be changed from Gauze to Solid Door by simply closing the gauze by means of a fan shaped Register or Sliding Plate—an arrangement by which air can be adm'tted into or excluded from the oven at will.

Don't you want to be the **Only Dealer** in your city that sells the **only line of stoves that cannot be duplicated?**

Facts of Interest to the Public.

Our "PROCESS" for 1895, we can say unqualifiedly, is the

MOST PERFECT WORKING

PROCESS STOVE EVER PLACED ON THE MARKET, and HAS NO EQUAL.

In calling attention to our

NEW GEM STOVE,

We offer the trade a STOVE FOR THE PEOPLE and FOR THE TIMES.

THE GEM STOVE is CONVENIENT

in SIZE, with the same sized flame as the PROCESS doing the same amount of work with **less fuel,** and at an original cost of only about ONE-HALF that of the regular high Stoves. This Stove is ABSOLUTELY our own, and CAN BE MADE ONLY BY US, and as pioneers in this business, the public naturally look to us for progress, while some of our competitors, who can only make the old line, call such improvements, "an innovation." Our GEM and PROCESS, together with our DELIGHT, celebrated JUNIORS, Individual and Single Generator Burner Stoves, &c., will give our trade a decided advantage over their competitors,

The L. & H. GAS RANGE

We claim superior.

It has the following improvements:

Removable oven, adjustable valve for all kinds of gases and pressures, needle point valve with lever handle with words "Open and Close" on them. Counter balance drop door. Best baker made. Complete in all detail. It is strictly first class. Buy it, try it, and you will have no other. Send for new catalogue. It contains the largest assortment of Stoves, Ranges, Ovens, &c., for gas, gasoline and kerosene.

A. J. LINDEMANN & HOVERSON CO.,

Branch House, Chicago, Ill. MILWAUKEE, WIS.

P. S.—Notice this advertisement. It will show a new improved stove every week.

A Good Creed.

Do not keep your love and tenderness sealed until your friends are dead. Fill their lives with sweetness. Speak approving, cheering words while their ears can hear them and while their hearts can be thrilled and made happier by them. The kind things you mean to say when they are gone, say before they go. The flowers you mean to send for their coffins, send to brighten and sweeten their homes before they leave them. If my friends have alabaster boxes laid away full of fragrant perfumes of sympathy and affection which they intend to break over my dead body, I would rather have a plain coffin without a flower, funeral without a eulogy, than a life without the sweetness of love and sympathy. Let us learn to anoint our friends beforehand for their burial. Post mortem kindness does not cheer the burdened spirit. Flowers on the coffin cast no fragrance backward over the weary way.—*West Jersey Press.*

— NEW AT THE BUSINESS.—She was a new telephone girl. "What number please?"

"One hundred and fifteen."

"I didn't catch that."

"One hundred—"

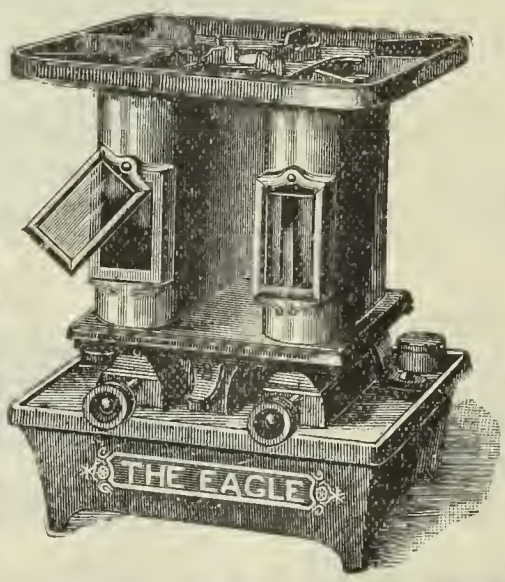
"Yes."

"And fifteen."

"All right. Here is one hundred. Fifteen is busy just now.—*Harper's Bazaar.*

— IT is when a woman gets caught in a shower with a new hat on that you may realize what a rain of terror is.—*Exchange.*

— WIGGS (quoting): "There's nothing like leather, you know, old boy."



Waggs: "Isn't there, though! You never saw any of the pie crust that our new hired girl turns out."—*Somerville Journal*

SOMETHING NEW AND STRIKING:

The Royal Excelsior Ranges!

Eighteen Sizes and Varieties.

(Cut shows Six-Hole Range With Reservoir, High Hot Closet and Cup Brackets.)

These goods will set your trade in motion this spring and keep it going indefinitely.

See Description on Opposite Page.

ISAAC A. SHEPPARD & CO., { PHILADELPHIA, PA. / BALTIMORE, MD.

MANUFACTURERS,

Admirable Trade Accelerators!

RANGES THAT SELL!

To sell goods now-a-days they must fairly bristle with good points. When Mrs. Noah moved out of the ark and set up housekeeping on Mount Ararat, she might have been satisfied to bale out hot water from an encased reservoir with a dipper (always spilling some on the stove top, of course), but modern housekeepers prefer to draw it off through a spigot, as those who use the **ROYAL EXCELSIOR RANGES** do. (This is our own patent. That is why you don't find other manufacturers using it.) Then there is also our "**ECLIPSE COVER,**" Three points: 1. Shape makes it strong—no place in it for a crack to start. 2. Cover lifted ***at center of gravity,*** the easiest possible way to lift a weight. 3. Cover lifted at once ***from any position***—no pulling or pushing it around to bring lifter hole toward the operator.

Eclipse Cover.
Patented December 29, 1891.

Damper easily replaced through pipe collar, having no rods to warp or burn out. Large end Hearth, sliding forward. Deep, roomy Ash Pit, Bailed Ash Pan, &c. Fire Box fitted for Wood, or Hard Coal, or Soft Coal, as desired Grates quickly removed without disturbing Fire Box Linings. Cross pieces so arranged as to bring four boiler holes directly into contact with the fire. Water Fronts for all sizes, with connections taken from the back to either right or left of range, so that circulating boiler may be used on either side. The Feet are independent of the Skirt Base, which bolts to the feet after the Range is set up, thereby enabling one man to put the entire apparatus in place. The design is the work of a superior artist. All edges are beautifully ornamented, and will look well as long as the range lasts. (Ground edges are hard to keep from rusting while goods are in stock, and turn blue and lose their good looks at the first fire. The ornamented edge is one of the greatest improvements of modern stove making.)

The mounting and fitting are of the best, and the added features of Nickeled "Alaska" Knobs, Nickel Name Plate, Nickel Oven Door Panel with Tile Center, Nickel Hinge Pins and Nickel Oven Door Pedal enhance the attractiveness of the goods

We cannot tell you all about these goods in a moment. Send to us for a descriptive and fully illustrated catalogue-circular. They are made with either four holes or six holes on top and with or without Reservoir.

If you buy one of these ranges, blacken it nicely and put it in a conspicuous place on your store floor, and if within 30 days you are not satisfied with it, you may send it back at our expense. (If you keep it over 30 days, of course it's a sale.) Does this proposition strike you as fair?

Welcome Stoves and Ranges.

KERNAN WELCOME RANGE.

Two Sizes, Portable or Brickset, Nos. 7 and 8. Made with Oven either Right or Left of Fire Box.

WE HAVE embodied in this Range all that years of experience can suggest, both in ornamentation and construction. The design is unusually pleasing, with large Top Surface, large Fire Box and Oven. We furnish with Duplex, Dockash or Plain Flat Grates. Our Fire Box is so arranged that the grate pulls out through the front opening without disturbing the water back or brick. Those who have repaired old style ranges will appreciate this improvement. Sheet Flue of ample size, guaranteed a quick baker and worker. Hot air for upper rooms is drawn from base and back of Range without interfering with the water back or Baking of Stove.

The Progressive dealers in Stoves and Ranges will find it wise to investigate and secure the sale of this modern Range. Write for Circulars and Prices.

—MANUFACTURED BY—

Syracuse Stove Works,

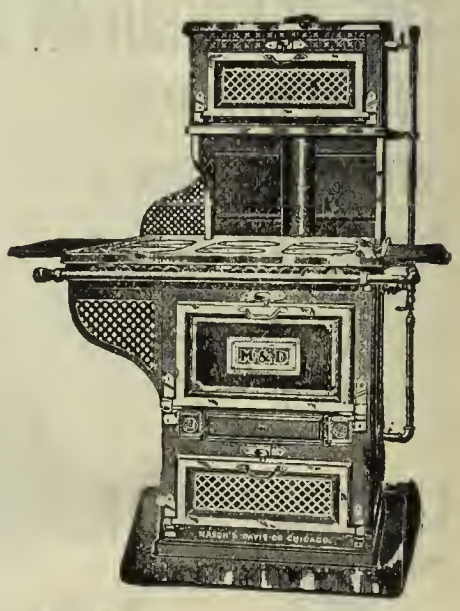
The Peninsular Stove Co.,

DETROIT. CHICAGO. BUFFALO.



THE ANNOUNCEMENT in a recent issue of THE METAL WORKER that we are soon to place on the market a Steel Climax Range having prompted the inquiry on the part of some of our patrons as to whether we design thereby to abandon the manufacture of our Celebrated Standard Climax Range, which has maintained supremacy for several years as an established leader of its class and against which not a single complaint has been filed in our office, we desire by this to inform the trade that the reputation of the Climax Range and constantly increasing demands for same is such as to preclude the possibility of abandonment if we felt disposed to do so. The Range, we are pleased to say, is more popular than ever, and the manufacture of same will be continued in all its varied conventional styles and sizes, and we sincerely trust that none will be deceived into a belief that an ***imitation*** now being offered to the trade is as good as the initial construction, which can only be procured of

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

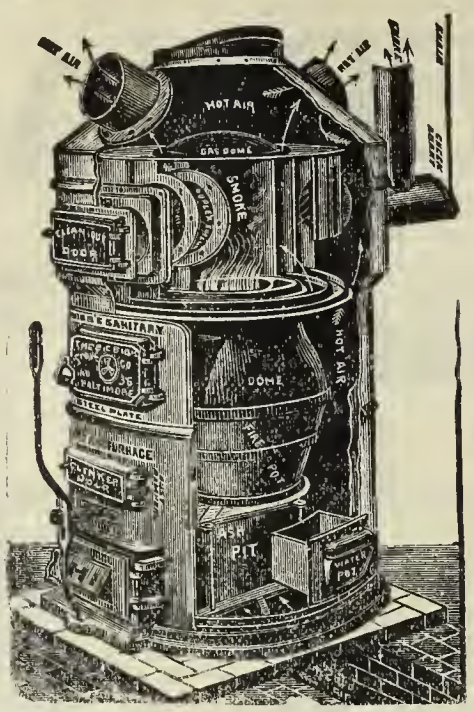
The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*



Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

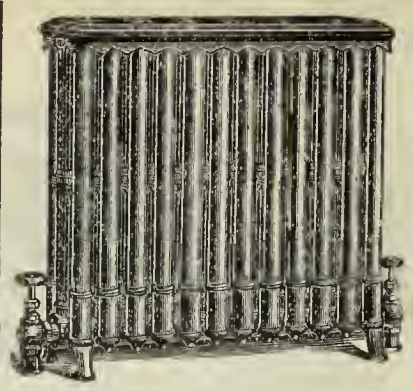
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

Challenge Iceberg Refrigerators,

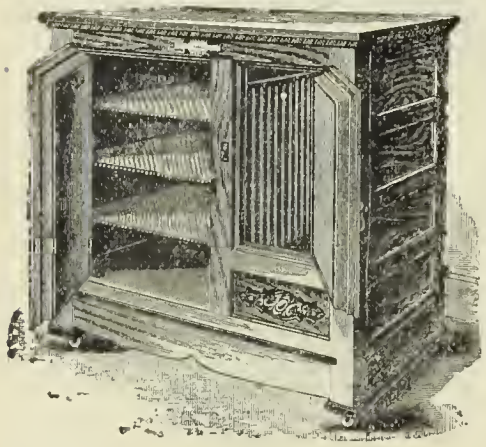
MANUFACTURED BY

The Challenge Corn Planter Co.,

GRAND HAVEN, MICH., U. S. A.

Write for our large Illustrated Catalogue for 1895.

All our goods are made of thoroughly kiln dried ash, finished in antique with Shellac and coach varnish. Panels are beautifully hand carved. Trimmings are of solid bronze and are our own pattern. We use our own patent air tight locks, patent self-retaining malleable casters and floor plates, and patent drip cups All Refrigerators are filled with pure charcoal. The Challenge Iceberg Refrigerators are the best made for preserving all articles stored therein pure and sweet, as there is always a circulation of pure, dry, cold air. Refrigerators having water coolers are provided with bronze faucet and cup holder. All Sideboards have a fine beveled French plate mirror. We manufacture Refrigerators of all sizes from the ordinary Ice Chest to the largest sizes for grocers' and butchers' use, including the most elegant line of Dining Room Sideboard Refrigerators ever put on the market.



THE CHALLENGE ICEBERG,

THE .·. HONEST .·. RELIABLE .·. REFRIGERATORS.

SELL THE BEST.

The Automatic Refrigerator

has more good points and does better work than any other and for that reason is a better seller.
Our illustrated catalogue for 1895 tells all about the line. Its advantages are:

Perfect circulation.
Large condensing and purifying capacity.
It has no flues to cause it to smell bad.
The trap is inside where it cannot be misplaced or lost.
The drip pipe may be cleaned without disturbing anything in either chamber, and is entirely out of the way.
It has nine walls to protect the ice and to maintain a uniform temperature in the cooling chamber.
It has woven wire provision shelves that are superior.
It has superior hardware.
It is more capacious and convenient.
Flavors of foods will not mix.
Last but not least, it's different, and will bring new customers and new trade.

We want the leading dealers to sell our goods and but one dealer in a place.
The goods are made of ash, and well finished.
We have two factories, one in the East and one in the West, and are able to take better care of your trade than if we had but one.

—THE IRON AGE—

HARDWARE PRICE BOOKS.

Arranged by R. R. WILLIAMS, Hardware Editor of The Iron Age.

THESE BOOKS are printed on paper of superior quality and bound in grain seal leather. They are all indexed through, care being taken to give each letter the proper amount of space for the accommodation of Hardware articles. Books A, B and C are issued in four editions: With 200 pages, price, $1.00; same with flap, $1.25; with 400 pages, $1.50; same with flap, $1.75. In the same manner book D has four editions, price, respectively, $2.00, $2.50, $3.00 and $3.50. Book E has but the one edition, priced at $5.00.

BOOK A.

Columns are provided for the name and number or size, for noting from whom purchased, date of quotation or purchase, list and discount, and for entering freight expenses as an element of cost. Under the heading of selling prices the regular and any special price or remarks in regard to the goods are given place. This book goes into considerable detail in describing the goods and cost prices. It has been arranged in accordance with the views of many Hardwaremen whose methods are careful and exact. Size, 4 x 7 in.; grain seal leather.

BOOK B.

This book contains headings and spacings for article, No. or size, list, discount, net cost, regular, special. Each page is complete, and the record of prices does not, as in Book A, run across two pages. Thus it accommodates a larger range of goods with much less detail in the record. It is adapted for office or store use, and by the use of familiar abbreviations sufficiently large for the convenient and concise record of prices. Size, 4 x 7 in.; grain seal leather

BOOK C.

The headings in book C run across the top, in a line parallel with the hinge. In this way a very complete record can be kept on a single page. The details of weight and freight contained in book A are omitted, and a single column headed "Add" given for the insertion of freight or other expenses which it is desirable to include in the cost. Under the selling prices space is left for the wholesale price, the retail price and also for any remarks in regard to cost of the goods, desirability of pushing them or other matters. Size 4½ x 7¾ in.; grain seal leather.

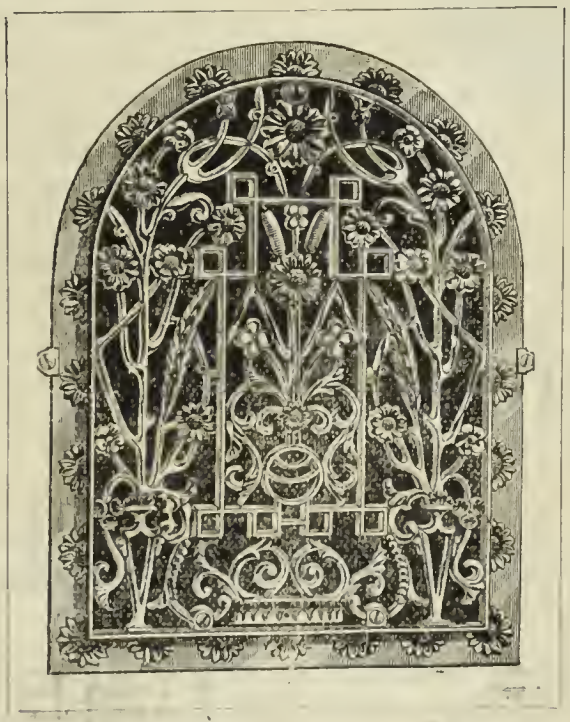
BOOK D.

Price Book D measures 5¼ x 8 inches, and will recommend itself particularly for desk and store use, and for salesmen on the road. It is strongly bound, and with a fine quality of heavy ledger paper, admitting of erasures and changes, and pages are numbered. The headings are conveniently arranged as follows:

Article. Number or Size. Regular Selling Price. Special Selling Price. Purchased from. Date of Quotation, Purchase or Invoice. List Price. Discount Net Cost. Weight. Freight. Total Cost.

BOOK E.

This is a large book, measuring 7 x 10 inches, and contains 280 pages. The binding is strong and the paper of the best heavy uality. Each page is complete with the following headings properly spaced:



Article. No. or Size. List. Discount. Add. Cost. Sell. Mem.

The special feature is the multiple system of indexing employed by means of three parallel marginal rows, which run through the entire book. Each index tab gives the first two or three letters of hardware articles, enabling the user to refer at a single motion to any goods. Special care has been taken to make the index classification correct and to provide sufficient space for recording of prices. Forty pages are reserved for supplemental quotations, memoranda, tables, &c.

Sent, postpaid, on receipt of price by DAVID WILLIAMS, Publisher, 96-102 Reade St., New York.

Cold Weather Casualties.

During the spell of severe cold last month a number of accidents in heating systems were reported. Some were of a serious character, doing considerable damage. In one case a radiator was taken from a hot water system and caps put on the ends of both the flow and return mains, stopping the circution through this portion of the system, which, being the larger portion of the system, interfered with the circulation and resulted in an explosion which caused considerable damage. It is not an unusual thing in house heating systems for the fire to be neglected to the extent that its effect is practically nullified, and in such weather as was experienced in February there seems to be little to prevent a system freezing up, which was the experience in a number of cases. In some cases the pipes were split and parts of the residence flooded, with the attending damage. In other cases the ice stopped the circulation in a hot water system and the return of condensation in steam system, but fortunately they were discovered in time to prevent serious accident, which would have resulted from kindling a fire.

Natural Gas in Foundry Cupolas.

The foundry trade is considerably agitated over the reports which have appeared almost simultaneously regarding the perfecting of new processes in producing ordinary castings and malleables. From Anderson, Ind., comes the statement that at last a method has been discovered for the successful use of natural gas or oil in melting pig iron and making ordinary castings. At Muncie, in the same State, malleable castings are also claimed to have been successfully made in a furnace operated on natural gas. Springfield, Ohio, comes to the front with another discovery by which it is asserted that malleable castings can be made as easily as ordinary castings, avoiding the time-honored practice of annealing, which requires several days, although the period has been greatly shortened within the past few years. All these processes are extremely valuable if on more general trial the claims of the inventors shall be fully sustained. The use of natural gas for melting pig iron in foundry cupolas would be confined within a comparatively limited area, but would be of much importance to foundrymen within that area. The use of oil would be of much wider application. Further developments in the several directions indicated will be awaited with much interest.

Reckless Building.

A deplorable instance of unscrupulous greed and reckless disregard of human life on the part of certain builders and contractors, combined with criminal negligence on the part of the officials intrusted with the authorization and inspection of new buildings, has recently occurred in New York City. A group of tenement houses in course of erection suddenly collapsed, burying five men in the ruins. Examination of the demolished structure revealed the fact that, in nearly every detail of their construction, the building laws had been outrageously violated. The mortar used was composed of a small proportion of sand, dug from the cellar and mixed with loam. Moreover, it had been applied when the temperature was below the freezing point. When the thaw came it melted into mud, consequently the building collapsed like a house of cards. Still further, crumbling stone was used for the foundation, and old bricks and beams, from the demolished building which formerly occupied the ground, had been used in the new structure. Party walls had no foundations at all. In every respect a more elaborately planned death trap could hardly have been designed. Responsibility for the disaster, according to the verdict of a coroner's jury of experts, is shared by several individuals, including the owner, architect, builder and the inspectors of the Building Department. All the guilty parties will, it is announced, be held to a strict accountability for this crime, and it is hoped that exemplary punishments will be meted out. The statement of a well-known New York builder, that he can point out other tenement houses in the city which have recently been run up with the approval of the Building Department under similar disgraceful conditions, is not calculated to promote confidence in the trustworthiness of that city department, one of whose officials admitted at the inquest that he was in the habit of marking plans for new buildings "O K" without examining them. The trouble is that, along with the other municipal departments, it has for a long time been run by men chosen for their political "pull," rather than for practical knowledge of their profession.

A remarkable revival of activity has been apparent in building circles in New York City during the past few weeks, as shown by the statistics published by the Building Department. The outlook for the industry during the coming spring promises very well. Real estate men report that unusually large amounts of capital are coming into the market for investment in new buildings, a marked feature of the situation being the projection of plans for important structures to take the place of old fashioned buildings in the district between Canal and Fourteenth streets. A table, published by the *Record and Guide*, exhibits the remarkable improvement which has occurred both in the number and in the value of the buildings planned so far this year, as compared with the same period of last year. To the end of the first week in March, 707 buildings, estimated in value at $17,665,359, were planned, as against 368 buildings, valued at $6,812,233, in the first 11 weeks of last year.

Superintendent Preston of the New York State Banking Department, in his annual report for last year on the savings banks, trust and safe deposit companies in the State, makes a very favorable showing for these institutions in spite of the prevalent and continued uncertainty in financial circles and the general business depression which compelled larger withdrawals of savings than would have been the case had the situation been more prosperous. On January 1 there were in the State, under the supervision of the department, 125 savings banks, 38 trust companies and 18 safe deposit companies, with combined resources of $1,391,297,-648.36. This shows an increase of $68,775,927.59 over the same date for 1894, when there were 125 savings banks, 36 trust companies and 17 safe deposit companies. The deposits in the 125 savings banks of the State, as shown by their January reports, were $643,873,574 44, an increase for the year of $26,784,125.46. No savings banks were closed during the year.

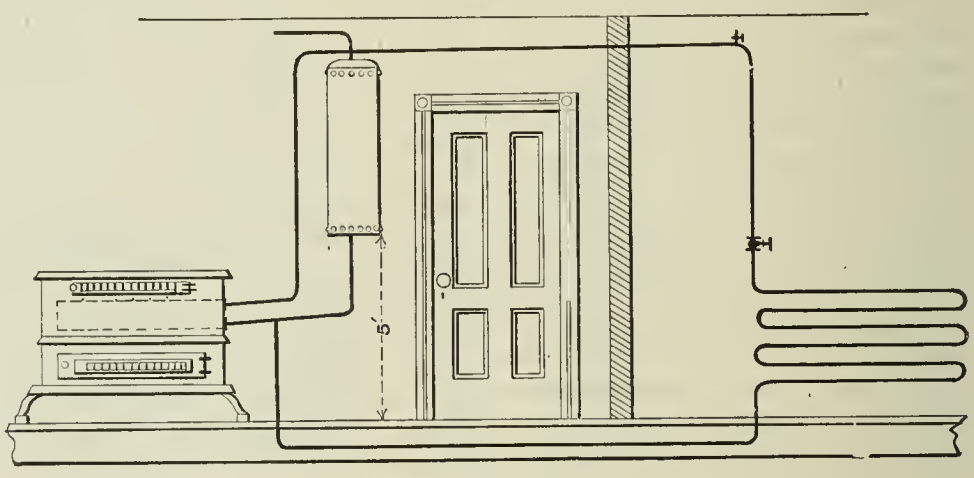
The New York *Journal of Commerce* published this week a special report, carefully prepared, of the present condition and the prospect of business in some 17 of the leading trades of the Eastern section, which affords gratifying evidence that business in this section is returning to normal conditions and that a good and healthy spring trade may be expected.

THE LETTER BOX.

Ventilating a Barn.

From J. A., *Vermont.*—Some time ago I received an order to put an 8-inch ventilator into a barn, the space to be ventilated being 20 by 27 feet, 8 feet high, and the basement of the same size. There is an opening 2½ inches wide and 10 feet long under the basement door which is to furnish fresh air. I ran the pipe direct from the basement through the floors and roof and carried it about 8 feet higher than the ridge. I put two 8-inch square holes in it in the stable part, one near the floor and one near the ceiling, and provided them with sliding doors to regulate the draft. The ventilator, however, does not work and my opinion is that the pipe is too small. There are six horses and a cow kept in the stable and pigs in the basement. The pipe is placed at one end of the stable floor. Would it be possible to get as good results in ventilating both rooms with one pipe as with the use of separate pipes, and if so, what size pipe would it be advisable to use? Would it make any difference whether the pipe went up in the center of the room or at one end? I will be glad to have the opinion of the readers on this subject.

Steam Diaphragm.



From W. R., *Cold Springs, N. Y.*—Please describe through the Letter Box the construction and uses of a diaphragm as used on steam heating plants.

Note.—The diaphragm most frequently used on steam plants is in connection with draft regulators. In some cases they are made of sheet metal and in others of leather, but more generally they are made of the same composition of rubber. They are placed in a chamber with a space on both sides, one side having an opening for the admission of steam from the boiler. On the other side is a piston to which is attached levers which connect with the check draft and the ash pit draft. When the pressure of steam distends the diaphragm one end of the lever is lowered and the draft at the ash pit is closed and that at the smoke pipe opened. When the pressure of steam falls below a certain degree the opposite operation results.

Will It Circulate?

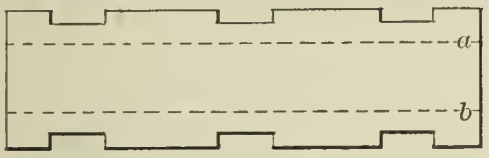
From F. T. M., *Steelton, Pa.*—I have read the letter "Will It Circulate?" in *The Metal Worker* of February 26, and I desire to ask a question on a similar subject. I want to heat my dining room with hot water from the kitchen boiler or with the boiler itself, and there is a door between the two rooms which interferes with running the pipes on the proper incline. I have made two sketches, which I inclose. In one I put the boiler near the stove and in the other the boiler is put in the dining room and the pipe run over the door to it and to the radiator, then the return is run under the floor back to the boiler in the dining room. I would like to know which will work best. I see in "Kitchen Boiler Connections" that in some cases the return is allowed to dip lower than the water back, but do not know to what extent it may be dipped with success.

Answer.—We have reproduced but one of the illustrations sent by the correspondent, as it shows the arrangement that will be satisfactory. If the boiler was placed in the dining room an objectionable heat wou'd be furnished during the summer season. If the brass connection is taken out of the top of the boiler and a galvanized iron pipe of the full size run up to a point above the top of the door and a cross put on it at this point, the difficulty of passing the door may be overcome.

Will It Circulate?

From the top of the cross the hot water service pipe to the house fixtures may be run. From the side of the cross, with a fall from it to the radiator, a ¾-inch pipe may be run, and owing to the fall the air cock will not be necessary, as the air in the radiator will pass up to the house service and escape at the faucets. A valve on this pipe may be placed either at the radiator or at a more convenient point to prevent circulation in the summer season. The return from the radiator may be dropped below the floor and carried over to the water back and connected at the water back rather than at the bottom of the boiler. If this pipe passes through a cold cellar it would be well to insulate it. In making a connection at the water back the same plan should be fol lowed as at the top of the boiler, except that a tee should be used. At the lowest point on this pipe a stop cock should be placed, so that in case it is desired to drain the entire system at any time it may be done and no water left in this pipe to freeze and burst the pipe.

Pipes Burst by Freezing.



From XENOPHON, *Tarrytown, N. Y.*—If freezing water exerts a pressure of 30,000 pounds per square inch, why is it that all pipes which freeze do not burst?

Answer.—The manner of freezing in pipes, as well as their elasticity, controls the amount of overpressure that causes them to burst during the freezing process. Water is at its greatest density at 39° F. Its density decreases slightly in falling to a temperature of 32° F., which causes its bulk to increase. When frozen its specific gravity is 0.922, 0.998 being the specific gravity of water at 32° F. Its bulk increasing in proportion to the specific gravities as water and ice, it expands 0.08553 its volume in freezing, while its compressibility being but a minute portion, its pressure becomes enormous when confined in iron, which contracts under the increasing cold and accounts for the bursting of the strongest shells or the flowing of solid ice out of a hole in a shell that is strong enough to produce a solid flow. The circumstances controlling the stability or bursting of pipes by freezing may be found principally in the interlocking of a portion of water between two points at a little distance apart by the pipe freezing solid at these points first, and as the freezing process crawls along the pipe with solid plugs behind it, the water of the central section by cooling comes under enormous pressure. On the contrary, when the freezing takes place slowly and uniformly along an exposed pipe, the ice is formed on the inner surface, growing gradually toward the center, and undue pressure is prevented by the water flowing away through the central opening, and when finally the center is closed uniformly along the section frozen the pressure is not increased by the continued fall in temperature, because as soon as it be-

comes solid its bulk decreases with increasing cold. The bursting power of confined water by cooling from 39° to 32° F. is beautifully illustrated by filling a bottle full with water at 39°, corking it tight and laying it on a cake of ice; it will generally burst before the water begins to freeze. The freezing of a drinking tumbler is an interesting experiment, illustrating both phases of this phenomenon. A tumbler full of water, if frozen from the bottom upward, seldom breaks. If frozen from the top down it seldom escapes fracture.

How to Bind "The Metal Worker."

From OLIVER TWIST —The advantages that are to be gained by having the weekly numbers of *The Metal Worker* all gathered together by means of some suitable binding cannot be overestimated, and it is fully appreciated by those who, when they wish to refer back for information about some particular thing they remembered seeing, long ago perhaps, and which would apply to the job on hand, would have to search through a pile of *Metal Workers* three feet high, which had been thoroughly mixed by previous searches. The following method will fill a need that has long existed among the tinners in coun-

How to Bind "The Metal Worker."

try towns, where it is next to impossible to get a book bound at all, and to say the least would be very expensive. The first thing to do is to take out the steel binders so as to allow the advertisements to be separated from the reading matter that we wish to save for future reference. This is composed of that part laying between Editorial Notes and Contents inclusive. If you take the trouble to take the square shears now, you may trim the papers all to one size, which will give them a better appearance when finished. Take two wire nails about 2 inches long and solder a copper burr to the head of each one. Gather up the papers in rotation according to date from January to June inclusive, and drive these nails at a point 4½ inches from each end and ½ inch in from the back edge right through the whole bundle. Now cut off the points that project through, and solder on burrs to correspond with the opposite side. Measure the thickness of the volume, and cut out a piece of tin like the cut, leaving 1 inch outside the lines *a* and *b*. Cut out three notches, as shown, each 2 inches long, which will form hinges for the covers to turn on, and wire with No. 12 wire. Bend at right angles on the lines *a b*, which represent the thickness of the volume. Put this on the back of the book, and 2 inches from each end drive a nail through and solder on a burr as before, only having the burrs outside the metal cover this time. This will securely fasten the cover to the book. All that remains to do now is to cut out two pieces for the back and front of cover. Fold them on four sides and solder on to the hinges, and you will have a volume which has cost you about ten cents for material and is neat in appearance and very useful. You can obtain from *The Metal Worker* office an index for each volume, which will make it easy for reference.

Water Hammer in Pipes.

From G. A. L., *Manchester, Vt.*— What effect will the closing of a fire hydrant quickly have on the plumbing fixtures in a house when the water supply is taken from the main and the range boiler has no relief valve? Would it not cause the boiler to leak or some of the other fixtures to burst, the water pressure being from 100 to 125 pounds? If any readers of *The Metal Worker* have had trouble of this sort I shall be glad to hear from them

From G. J. M., *Oshkosh, Wis.*—I have done a job of plumbing in a house where the authorities required the use of self-closing work. Now, when they draw water at the sink and let go of the faucet it pounds over all the house. Another trouble is that the ball cocks drop and splash the water out of the flush tanks. There are no air chambers in any part of the house and we cannot very well put them on the closet supply, neither would it be convenient to place them at the sink. Would it remedy the trouble if the air chamber was put in the cellar, or what would be the best thing to do under the circumstances? Please tell me what would make the best air chamber, what size to use and all about it.

Automatic Damper Regulator.

From M. F. I., *Canada.*—Will any of the readers of *The Metal Worker* inform me if there is any automatic device for regulating hot air dampers from the ground floor? If so, where is the device made?

High Pressure Water Heating.

From C. C. S., *Woodbury, N. J.*— Please inform me what is meant by high pressure water heating and what is meant by low pressure hot water heating.

Answer.—On all hot water heating systems an expansion tank is located at some point to receive the excess of water in the heating plant due to expansion when it is heated. In low pressure heating this expansion tank is open to the atmosphere, and no attempt is made to confine the water under pressure. In high pressure heating the expansion tank is hermetically sealed, leaving a space equal to one-twelfth of the bulk of water in the system for air in the tank above the water line in the system when the water is cold. When the water expands the air acts as a cushion and the pressure is proportional to the amount of space left in the air chamber, a small air space resulting in a high pressure and the pressure being reduced as the air space is enlarged. On such system a safety valve is always placed on the expansion tank at the top of the air chamber to permit the escape of air or water after the pressure has reached a given point. Some experience and skill is required in adjusting the pressure hot water heating system correctly, and the use of such systems is very small compared to what is known as open tank or low pressure system. In case of the safety valve being weighted too heavily or becoming stuck to the seat, higher pressure is liable to be developed in the system than was intended, and in some cases the system has burst with considerable force and damage. On the liberation of water heated to a temperature considerably above 212°, owing to the pressure the water immediately turns into steam. Experienced men prefer the open tank or low pressure heating.

Radiating and Heating Surfaces.

From F. F. G., *Belvidere, Ill.*—How many square feet of radiating surface will 1 square foot of heating surface supply?

Answer.—The following extract from Baldwin's "Steam Heating for Buildings" indicates the difficulty of answering the question exactly: "There is no simple relation between the heating surfaces of boilers and the radiating surfaces of the buildings they have to supply the steam to, for the following considerations apply to every type of boiler: The method of setting, what the grate surface is, the character of the work they are designed for, and whether the air is simply to be maintained at a certain temperature, as in direct radiation, or whether every cubic foot of air which comes in contact with the radiator must be warmed from the outside temperature, as in indirect radiation, or whether the apparatus is direct-indirect or composite, all of which would have to be considered, and the results would then only be approximate; for even then, neglect of cleaning, a certain amount of neglect of management, and the state of the fire—whether on the first hour of the new fire, or the last hour of the dirty fire, for the time they are to run, must enter into this calculation.

"If the effect of the cooling produced by loss through the glass and walls of a building can be estimated and added to the amount of heat lost in warming the air admitted for ventilation, a close estimate can be made of the smallest grate which would burn fuel enough to evaporate the amount of water in a boiler sufficiently large; but the following points the constructor must never lose sight of in estimating for an automatically fitted boiler—namely, that it is the amount of opening in the draft door which regulates the fuel burned; next, the fuel burned regulates the water evaporated; and, finally, the water evaporated regulates the heat—both the heat of the room (by having a sufficiently large heater) and the heat (or pressure) necessary to move the diaphragm—which regulates the draft, so that really what is required are certain limits within which he knows he is

safe and to exceed which would be an unnecessary expense.

"Boilers for very large buildings, which have an engineer in charge, may be figured pretty closely; as he is supposed to be constantly at his post, and to clean his boiler fires regularly; and to fire often, and in small quantities, keeping his fire door open the shortest time possible, and further, to clean the tubes or flues whenever required. But this is not the case in house boilers. They must run for long periods without cleaning or inspection, and be adequate to every contingency of change within their limit of time to keep steam. It has been found by experiment in a general way, and from practice, that for ordinary buildings with average window surface and for the greatest range of temperature in our Northern States, when nothing but direct radiation with no ventilation is used, 1 square foot of boiler surface to 10 square feet of radiating surface will answer; assuming the radiating surface is ample. For indirect radiation, if the heating or radiating surfaces of the coils are figured double what they would be for direct radiation without ventilation, the same proportion of boiler to coil will suffice; but if, instead of doubling, the same surface be used or a slight increase, as one-fourth or one-third, and the building be kept warm by moving the air faster through a small coil, we must proportion the boiler the same as if we did double—that is, allow 1 square foot of boiler surface to 5 square feet of coil surface, the same as figured for direct radiation, bearing in mind, a boiler is proportioned to the cooling which goes on—heating, ventilating, &c.—and not to the coil surface, unless the coil surface is known to be ample for the conditions of temperature, &c.

"When the air is forced (as with a fan) more heat can be taken from a coil in the same time than when the air moves naturally from a difference in temperature, but as the heat necessary for the building remains the same the boiler must be proportioned to the building, and when the proper coil surface has been found sufficient to maintain the heat for the range in temperature incidental to the climate and local conditions, it establishes the simplest data from which to calculate the boiler. For direct-indirect radiation, proportion the boiler one and one-half times greater than it would be for direct radiation. These estimates are for boilers with ordinary high combustion, such as horizontal boilers, which are kept clean without interruption, but for house boilers (wrought iron shell), with slower combustion, an addition of from one-eighth to one-fourth may be used, and in small water tube boilers (pipe boilers) one-fourth to one-half may be added, in the judgment of the fitter."

The following extract is from Hood, on "Warming Buildings by Hot Water:" "It is obvious that the extent of surface which a boiler ought to expose to the fire should be proportional to the quantity of pipe that is required to be heated by it, and it is not difficult to estimate these relative proportions with sufficient accuracy, notwithstanding the various circumstances which modify the effect. It has been proved by experiments that 4 square feet of surface of an iron boiler will evaporate 1 cubic foot of water per hour, when exposed to the direct action of a tolerably strong fire. This, however, requires free exposure to the radiant heat of the fire; for the heat communicated to the flue surfaces is only equal to one-third of that which is derived by the direct action of the fire acting upon the bottom or sides of the boiler. And it can be ascertained by calculation that the same extent of heating surface which will evaporate 1 cubic foot of water per hour from the mean temperature of 52°, will be sufficient to supply the requisite heat to 232 feet of pipe 4 inches in diameter when the temperature of this pipe is to be kept at 140° above that of the surrounding air. From this, then, it appears that 1 square foot of boiler surface exposed to the direct action of the fire, or 3 square feet of flue surface, will be sufficient in a hot water apparatus to supply the necessary heat to about 58 superficial feet of pipe, or in round numbers, the proportion may be stated as 1 foot of boiler to 50 feet of pipe. As this, however, is almost the maximum quantity of pipe which can be heated, or, in other words, the maximum effect which can be produced without mechanical means of producing draft, it is very desirable in all cases to allow an increased surface of the boiler, bearing in mind that not only will economy of fuel be thereby produced, but the apparatus will be much easier managed and thus become more effectual and certain in operation.

"A small apparatus ought always to have more surface of boiler, in proportion to the length of pipe, than a larger one; as the fire is less intense, and burns to less advantage in a small than in a larger furnace. The effect also depends greatly upon the quality of the coal, the hight of the chimney, the rapidity of draft, the construction of the furnace, and many other particulars; and it will always be found more economical, as regards the consumption of fuel, to work with a larger surface of boiler at a moderate heat, than to keep the boiler at its maximum temperature. A useful formula for calculating the effect of boilers and furnaces in most common cases is as follows: One square foot of boiler surface exposed to the direct action of the fire will boil 11 gallons of water from 52° to 212° F. per hour; or, in other words, it will add 160° of heat to 11 gallons of water. Or the same surface will evaporate 1½ gallons of water per hour. The area of the furnace bars should be about one-sixth that of the boiler surface."

Question of Gas Pressure.

From G. W. FERRIS, *South Manchester, Conn.*—In *The Metal Worker* of February 2 I notice the item from "G. E. S.," Pennsylvania, complaining of trouble with gas pipe in cold weather. The same trouble was experienced here with a 6-inch pipe which crossed a bridge about 6 feet below the line of the bridge floor. In very cold weather the pressure was greatly diminished, so much so that my gas stove in the shop would not work properly. This year the company have covered the pipe and I think they use a cow hair composition, and notwithstanding the recent severe weather we have had no trouble this year.

Inside Cold Air Duct.

From SPEC., *Spencer, Ill.*—B. Reese, Odessa, seems to be a good writer on tinner's matters, and the writer would like him to give his experience on the use of inside air ducts—I mean taking air from the halls to supply a furnace with cold air. Should the inside cold air duct be equal to the area of the heating pipes, or should the accustomed three-fourths of the outlet be used for the supply pipe in such cases? Does it make any difference whether the air duct is run down close alongside of the furnace or should it be run underground a considerable distance before reaching the furnace? In a word, what is the best known plan to follow in using a cold air supply from hall?

What Is a Vacuum?

From P. J. R., *Connecticut.*—Noticing the very many valuable explanations you have given in the Letter Box, I would like to have you help me by giving an explanation of the word "vacuum." I know that siphonage results from a vacuum or partial vacuum being formed in the waste pipe beyond the trap, and that every time a fixture is emptied there is a certain amount of air displaced which must find its way out of the pipe through either the vent or, if not vented, through the weak seal of the other traps on the line, and I have noticed that on a long line of waste pipe there seems to be a strong suction after a fixture has been emptied which will cause the water to be drawn out of the trap when not relieved by a vent pipe, but still I am not able to explain what a vacuum is. I have an idea of what it is, but do not know how to express myself. Will you kindly inform me what the proper explanation of the word may be?

Answer.—A vacuum is merely a space where there is nothing. That is the dictionary definition, but as used in everyday talk and in reference to sanitary matters, it refers to a space from which the air has been exhausted to a greater or less degree. When this occurs in pipes there is a tendency for the water adjacent to this space to rush in and fill it on account of the pressure of the external air. Nature always endeavors to establish an equilibrium of pressure, and it is because of this law that we are able to make use of the suction pump, that device illustrating what a vacuum is and how its presence operates. In raising the plunger of a pump the air in the pump chamber is

exhausted and a vacuum formed, or, strictly speaking, a partial vacuum. The result is that the normal air pressure on the water forces it up to fill this chamber and so establish equilibrium. A repetition of this process enables us to raise water. An absolute vacuum is a space from which the air has been completely exhausted or expelled. A partial vacuum means that the air has only been partly exhausted, and the result is that the pressure there is lessened to a greater or less degree. In an absolute vacuum the pressure gauge would fall $14\frac{7}{10}$ pounds, as compared with the record in the atmosphere.

A Peculiar Furnace Experience.

From E. E. PALMER, *Harrisburg* — In *The Metal Worker* of the 9th I noticed an article "A Peculiar Furnace Experience," and became interested in it and also your reply. Please allow me to offer the following as cause for the "peculiar experience." The room from which the attempt is made to draw cold air to the furnace is already supplied with means for the escape of the air in the room, and more besides, and it is the strong draft in the fire place flue that causes the cold air pipe to have the contrary movement of air in it. The amount of air carried out of the room through this flue is probably in excess of the amount delivered through the warm air register, and the cold air pipe is simply acting as a supply pipe which allows enough air to come into the room to supply the demand of the fire place flue. The cold air currents which were objectionable might have been caused in one of two ways. The fire place acting as a ventilator for the whole house drew all the cold air on the floors toward it, or, if the room was kept closed during cold weather, the warm air register could not deliver air enough to supply the fire place flue, consequently every crack and crevice around doors and windows admitted air, which, entering the room, would be drawn directly to the fire place flue and cause cold currents on the floor of the room. I believe the fire place to be the cause of the back action in this case, and while it is admitted that the fire place is a good ventilator, many times they ventilate too much, and it becomes necessary to partly close them up with summer pieces or in some other way so that the outlet will not be so great. The opening to many of them is from 3 to $3\frac{1}{2}$ feet above the floor, and I have known of cases where it was impossible to warm a room until the opening had been reduced and the cold air drawn off at the floor.

From R. S., *Brooklyn.*—I notice the letter from "C. S.," Cleveland, Ohio, in *The Metal Worker* of March 9. If "C. S." and all other furnacemen would imagine a house was submerged in water they would have less trouble in solving their heating problems. The pressure throughout all parts is equal until the heat is applied by the furnace, which makes the air lighter. There is an unlimited supply of cold air to enter the furnace, and when the air is heated it will rise. When an exhaust pipe is taken from a room to the base of the heater a circulation should follow unless the heat makes it escape through some other channel. In the case reported there seems to have been no circulation of air. but an ample supply of air forces heated air up what should be the return pipe of the circulating system. This shows that there is a faucet open on the system somewhere, and until this faucet is closed circulation will not exist. I will suggest to him to hunt for this faucet and close it. If the fire place shown on his sketch is open in all probability he will find that it is the faucet.

Collapsed With a Vacuum Valve.

From M. A. C., *Petoskey, Mich.*— Recently we had a 30 gallon copper boiler collapse, and are at a loss to know what caused it. The boiler was connected with a range in the usual manner. On top of the boiler in the supply pipe was a $\frac{3}{4}$ inch vacuum valve, the supply pipe continuing down into the boiler with a hole in the delivery pipe near the top. We get our water supply from a reservoir located on a hill. The water is pumped through the mains to the reservoir, and at the pumping station there is a pressure of 120 pounds. When the water becomes dirty they close the valve near the reservoir and open one near the pumping station, drawing all the water out of the main. The boiler collapsed while drawing the water out of the main. The vacuum valve was in good condition when I examined it soon after the boiler collapsed, and was not stuck fast with sediment. There is about 40 pounds pressure on the boiler when in use, and the water is carried direct from the main to the boiler. I should like to know what caused the collapse and what will prevent it in the future.

Note.—If the vacuum valve was loose and in working order, it probably became so through the jar and shock of the collapse. Had it opened when the tendency toward a vacuum occurred, air would have rushed in and the collapse would have been prevented. If our readers can give any light on this subject we shall be glad to hear from them.

Paste for Asbestos Paper.

From W. H., *Indiana, Pa.*—In *The Metal Worker* of March 2 I see an inquiry from J. Callahan & Sons of Cleveland, who want a paste for putting asbestos paper on hot air pipes. If he takes his paper and soaks it with water and puts it on the pipes with plenty of lap, it will stay there. It also can be put on steam pipes in this way with excellent results.

From J. R. L, *Binghamton, N. Y.*— In reply to the inquiry in *The Metal Worker* of March 2 respecting paste for asbestos, would say that I have found the best method to stick asbestos on heater pipes is to lay the paper on flat and rub with the hand until a paste is formed of the asbestos. I found that simply wetting did not make it stick sufficiently.

Wants to Stop a Gas Leak.

From J. M., *Greencastle, Ind.*—Is there any known way of stopping a line of gas pipe from leaking which is inclosed in a partition and under floor without taking it out?

A Question in Furnace Construction.

From CONTACTOR, *United States.*— I don't mind opening up on "Contention," having read his letter in *The Metal Worker* of February 23. In the first place he is wrong, like the whole furnace trade, in calling the upper section of his furnace a radiator, because air does not heat appreciably by radiation. If it did not radiate any more than an iceberg, but still kept hot, it would answer just as good a purpose in a furnace. Air is heated by being brought into contact with a hot surface, and then passes along and heats other cool air by mixing with it. Consequently, a more sensible name for the internals of a furnace would be "Contactor." Now, the United States having got into contact with Canada, I will proceed with the contention. As air is heated by contact I am strongly in favor of a space between the fire pot and the contactor. If the contactor is cast as a part of the ash pit air cannot pass up on the inner side, hence that surface of the contactor is lost, and also that of the fire pot. If the space between the contactor and the casing is too great the air current passing will not be heated on its outer side. I was talking only yesterday with a bright and successful furnaceman who sets furnaces in three States, and he incidentally remarked that he had used all kinds of furnaces, but got the best results from a style he pointed out. It had a cast iron central dome surrounded by a circular steel contactor. He calculated that he got a large amount of hot air from the space inside of the contactor. Take a 40-inch casing and put a 32 inch solid top contactor in it, and the area of the air space will be about 450 inches Now make the contactor of the two-cylinder type, making the inner cylinder 24 inches in diameter surrounding an 18 inch dome. They will make first class heating surfaces and the construction will give an air space of 200 inches in area. The air from this space will be hotter than the other air and will increase the capacity of the furnace at least one-third. Have an air space by all means, "Contention," and arrange your contactors to make them available. If you want your contactor to be a radiator, arrange a circular sheet iron contactor to surround it. This contactor should reach from the middle of the fire pot to the top of the radiator-contactor, then by absorbing radiant heat and being hot on both sides it will split the air currents, and doing double duty as a secondary contactor it will prove almost as efficient as a primary contactor.

Which is the Best for Furnace Tops?

From T. O. M., *Adams, N. Y.*—Replying to the inquiry of "J. C.," Cleveland, that appeared in *The Metal Worker* of March 2, would say that I think he will be obliged to look somewhere else for the difficulty with his furnace work. Taking the hot air pipes from the top of the hood is considered good form in this cold country where there is room to do so and still give the pipes free pitch from the furnace to the registers. Let him take a good, thorough look all around and see if he does not find some other cause for the trouble. Especially let him see if there is any way of taking the cold air out of the rooms into which he wishes to introduce hot air.

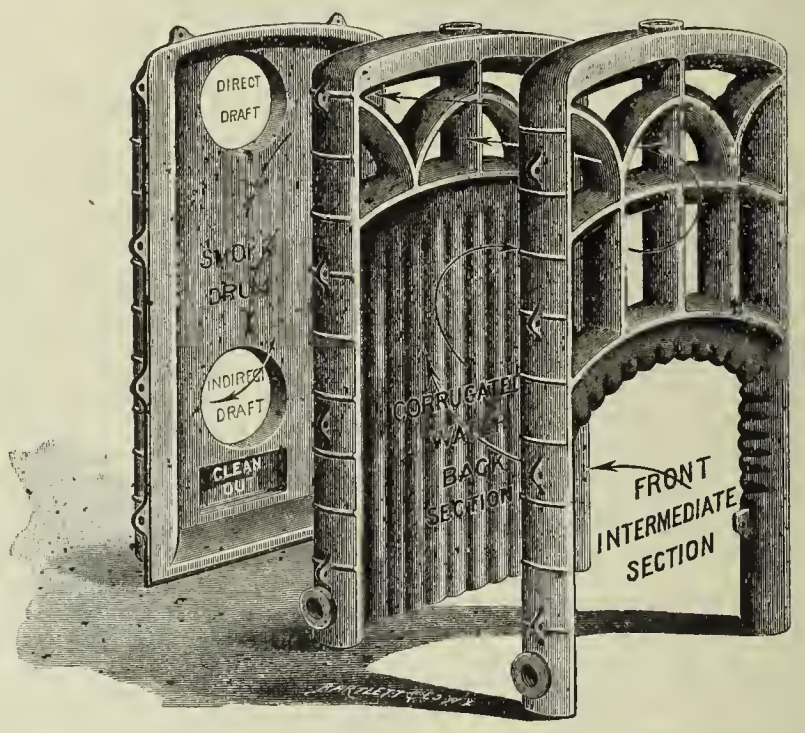
STEAM AND HOT WATER.

The Steam Fitters' Convention.

A letter has been received by *The Metal Worker* from J. Leland Wells, chairman of the Executive Committee of the Master Steam and Hot Water Fitters' Association of the United States, stating that the seventh annual convention of the association will be held in Philadelphia on June 13, 14 and 15. This is the same week that the National Association of Master Plumbers hold their convention, and is to enable those who are interested in both associations to attend both conventions.

The Carton Boilers.

The Carton Furnace Company, Utica, N. Y., have brought out a line of Carton safety sectional steam and hot water boilers which the trade will be interested in reading about. The illustrations presented herewith show very completely the construction of the Carton steam boiler. The hot water boiler is of the same general appearance without the steam trimmings; the description, therefore, will suffice for both. In designing the apparatus it was made so that the products of combustion would, it is claimed, impinge positively upon over 90 per cent. of the surface, nearly all the surface being horizontal, while the circulation of water is vertical. Especial care was taken in arranging and proportioning the water and steam passages so as to assure perfect circulation at any pressure. Fig. 1 shows the Carton steam boiler with side cut away, revealing the flue arrangement and showing the course of the products of combustion. The boiler is made in portable form and can be set in brick if desired. All joints are screwed and are on the outside of the boiler, where they can be easily reached. Attention is directed to the large doors over the fire box, which give easy access to the smoke flues, so as to permit their thorough cleaning from the front of the boiler. In Fig. 2 is shown an intermediate section, the water back section and smoke drum which forms the diving flue. A recess is shown on the water back section, forming a flue through which the smoke and gases rise before traveling through the lower smoke ports to the front of the boiler, where they again rise and travel to the rear of the boiler through the top smoke ports, where the fuel products may be taken direct to the chimney through the upper smoke collar or carried to the bottom of the smoke drum through the return flue to the chimney. The cut shows the horizontal boiler surface and the double corrugations in the fire box and water back. Fig. 3 is a view of the intermediate section of the boiler, showing more clearly the water ways and water line, while Fig. 4 is a back section of the boiler. It is mentioned that the vertical curved water ways in the steam space directly above the water line act as relief ports and prevent any foaming of the boiler and allow the steam to pass off perfectly dry. In Fig. 5 is presented a view of the grate used in the Carton steam boiler. It is the Smyth duplex, and can be easily shaken and dumped. It is operated by a lever bar in front, and in case repairs are at any time necessary any grate bar can be removed through the feed door without disturbing the entire grate. The steam boilers are made in eight sizes, with fire chamber measuring from 15 x 20 inches to 57 x 20 inches, and adapted to heat with covered mains from 393 to 1264 square feet of direct radiation. The hot water boilers of similar size are adapted to supply with covered mains from 750 to 2500 square feet of direct radiation. Tables furnished by the Carton Furnace Company give likewise the rating of the



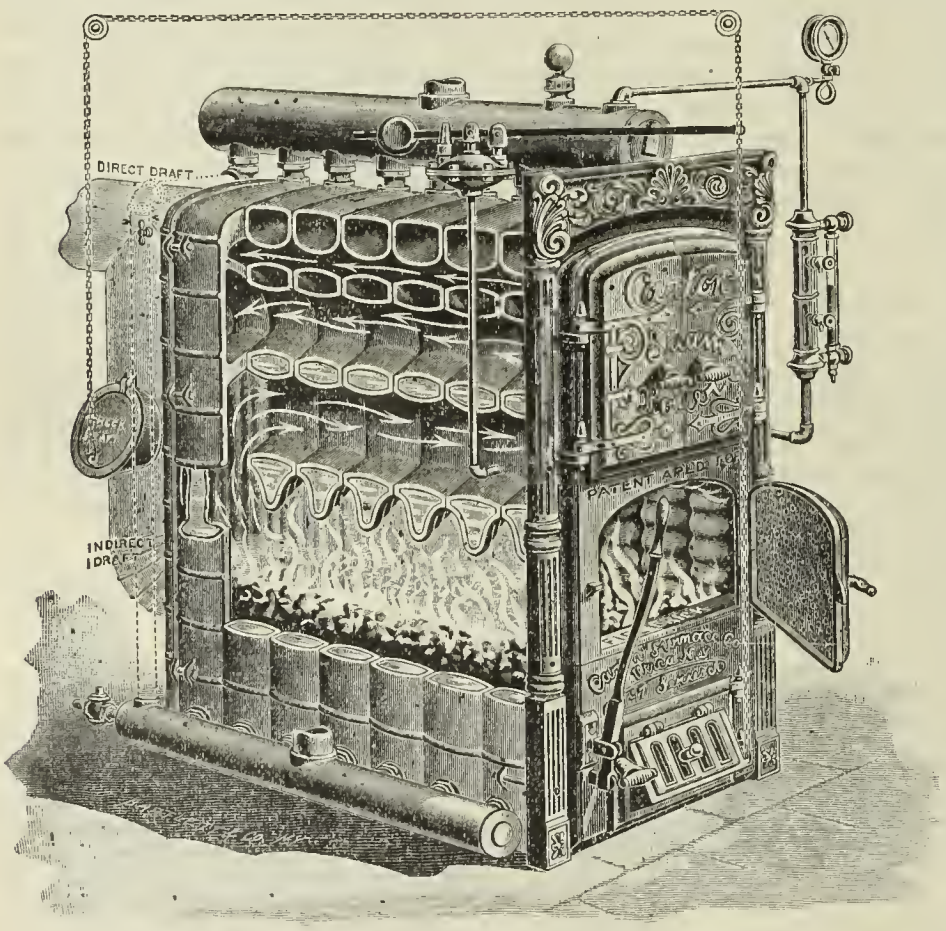


Fig. 2.—View of Sections.

The Carton Boilers.—Fig. 1.—Broken View of Steam Boiler.

Carton boilers for greenhouse and conservatory heating. William J. Baldwin, the well-known heating engineer, has made an exhaustive test of the boiler, and the report, which is as follows, will be read with interest in connection with the description :

The boiler was composed of a front, three vertical intermediate sections forming a fire box, and a back section. The sections were connected at their lower outside extremities by 2 inch lock nut nipples with return pipe headers, and at their top centers, in like manner, with a steam header. The grate area was 20 x 21 inches, and the grate was of a rocking pattern. The fire box is formed by a fire brick lined front. The three intermediate sections and one back section were corrugated in two directions, a large corrugation being formed in one direction, while across the large corrugation, in the other direction, was formed a smaller corrugation, the whole of which presented a large heating surface, in direct opposition to the fire. The general arrangement of the boiler provided for taking the products of combustion backward over the fire, thence upward and forward through one set of flues, and re turning it again to the rear by a set of passages formed in the castings and above those already mentioned. As the boiler is intended as a house heating boiler, either as a steam or as a hot water boiler, and as it was more convenient to make the trials as a steam boiler, the boiler was set up to simulate actual conditions of low pressure steam heating. The boiler was connected with an ordinary chimney of about 35 feet in hight, with natural draft and slow combustion. The trials were made at a steam pressure of 5 pounds, and cold water was fed into the boiler at a temperature of 52°.F. per pound of combustible— the ashes and clinkers having been weighed back —was 10.07 pounds of water from 52° F. to 5 pounds pressure of steam. The equivalent evaporation per pound of coal from water at 212° F. to 5 pounds pressure of steam is 10.2 pounds of water. combustible burned per square foot of grate per hour was 4.76 pounds. The amount of water evaporated from 52° F. to 5 pounds steam pressure per square foot of average boiler surface per hour was 2 17 pounds. The equivalent evaporation of water from 212° F.

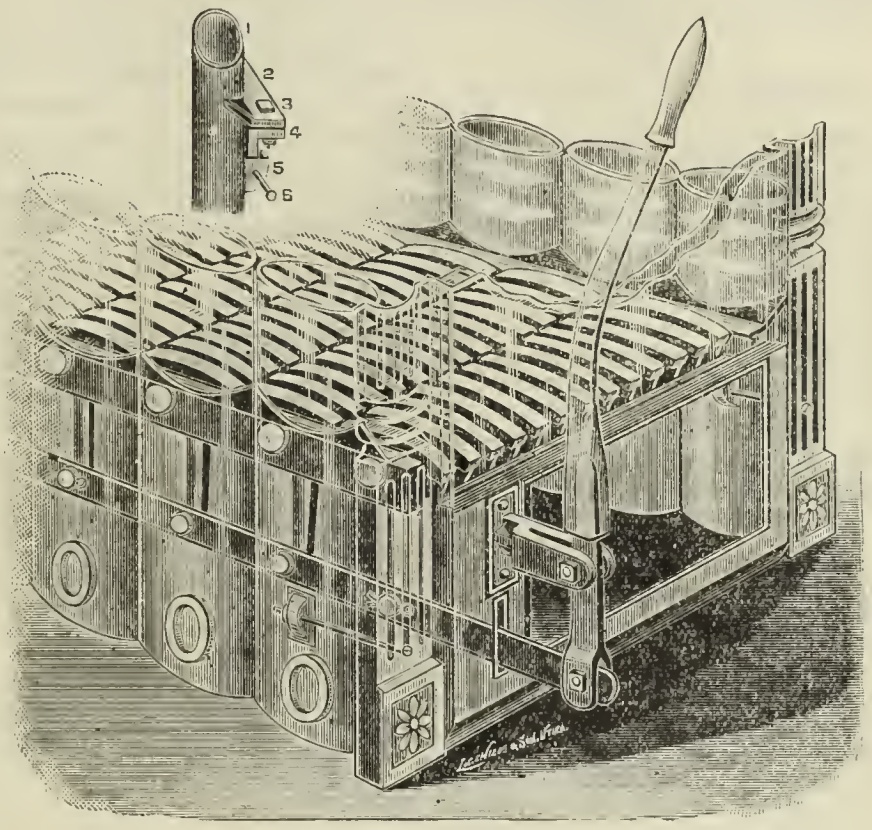

Fig. 5.—Grate.

The equivalent evaporation, therefore, from the temperature of the return water, in a gravity apparatus, to low pressure steam is approximately 10 to 5 pounds steam pressure, per square foot of average boiler surface per hour, is 2.368 pounds of water. Calorimeter tests of the quality of the steam were made from time to time which showed that the steam was practically at maximum density, or in other words, the steam was dry.

The rating of the No. 4 boiler above described and tested is 640 square feet of radiation for house heating by steam when the pressure is low (say 1 to 5 pounds). The above calculation of heating surface is based on the use of 5 pounds of coal per square foot of grate, and forms the maximum condition for a house heating boiler. You will note that when the rate of combustion is equal to 5 pounds of good anthracite coal per square foot of grate per hour 1 square foot of average boiler surface evaporated sufficient steam for 10 square feet average radiation, an exceedingly high efficiency and rarely obtained in practice. The low temperature at which the gases of combustion entered the chimney, ranging from 3° to 21° above the temperature of the steam, shows that the boiler utilizes about all the available heat of the fuel.

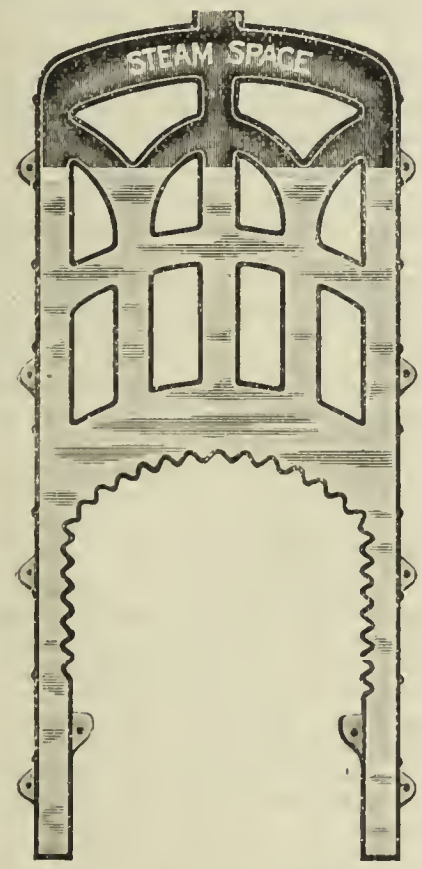

Fig. 3.—Intermediate Section.

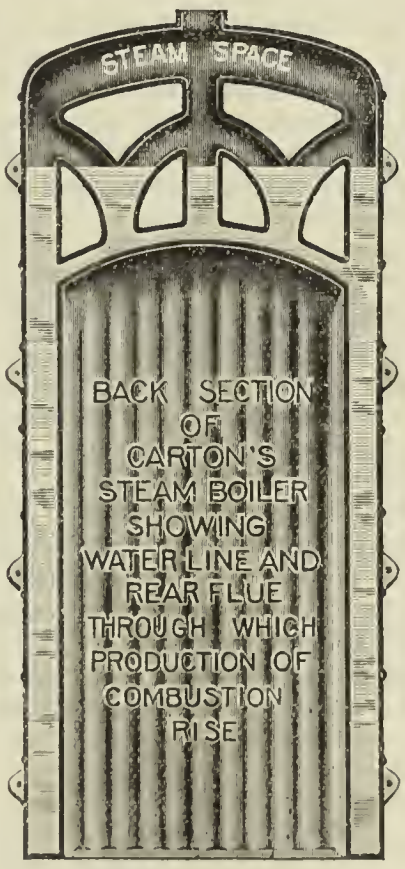

Fig. 4.—Back Section.

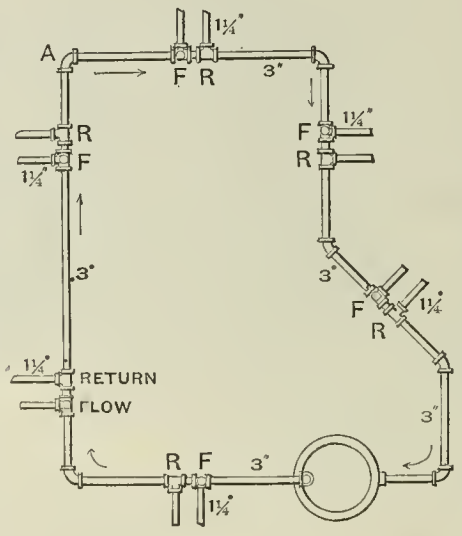
The temperature of the flue gases as they passed through a short smoke pipe ranged from 230° F. to 248° F. during the trials. The evaporation of water from 52° F. to 5 pounds pressure of steam was 9.32 pounds of water per pound of dry coal. The evaporation pounds of water per pound of coal. The equivalent evaporation per pound of combustible from water at 212° F. to 5 pounds pressure of steam is 11.02 pounds of water. The amount of coal burned per square foot of grate per hour was 5 14 pounds. The amount of

---



The Haydenville Mfg Company, 73 Beekman street, New York, have issued a compactly arranged catalogue of 372 pages, devoted to Brass and Iron Valves and Cocks for steam, gas, water, oil and chemicals; also Engine, Pump and Ship Builders' and Machinists' Supplies and Tools and Plumbers' Material. Among the goods of which the company make a specialty, under the common name of Haydenville, are included Finished Lavatory Valves, Gas Log Valves, Needle Valves, Disk Globe Valves extra heavy, Quick Opening Hot Water Radiator Valves, Fire Hose Valves, Double Gate Valves, Throttle Valves, Packed Plug Steam Cock and Bayonet Top Oil

Cups. In addition to the foregoing a specialty is also made of Steam Pressure Regulators, Elevator Regulating Valves, Vanwie's Swing Check Valves; Engine, Globe and Angle Valves and Cushman's Steam and Water Vaporizers. The catalogue is miniature in size, measuring about 4 x 6 inches, and is fully illustrated, with prices.

A Circuit Hot Water Job.

From L. E, *St Louis.*—Knowing that all the editor of *The Metal Worker* has to do is to answer the questions that are put to him these hard times and dull days, and having nothing to do myself, I ask a few questions, just to keep the editor busy and also, perhaps, gain some information. I wish to know what rule is used to calculate the number of feet of radiation that different sizes of pipe will carry in hot water systems. If there is no rule please state how many feet of radiation in ordinary house heating can be carried by 1, 1¼, 1½, 2, 2½ and 3 inch pipes. In all of the shops in which I have worked different ways of figuring are used and every "boss" claims to know it all and that the other fellow does not know what he is talking about. I am looking over a set of plans this evening in which the architect specifies a single 3 inch circuit main to be used for both flow and return. The flow pipes to the radiators are to be taken from the top of the main and the return pipes to be connected at the side of the main, thereby forming two currents of water in pipe. The architect says (and of course he knows it all) that he has one heating plant of this kind in operation at St. Louis giving perfect satisfaction. There will be 745 square feet of radiation in the plant, and what is a mystery to me is how two currents of water can be formed in one pipe. I have an idea that it is done in the same way that two trains moving in opposite directions pass on a single track. I would like to hear from some of the practical hot water readers upon this subject. The sketch shows the heating plant, which is to be put in on the one-pipe system with the highest point in the circuit main at A.

Note.—In *The Metal Worker*, October 20, 1894, a circuit system of hot water piping was shown in a combination plant, and on March 2, 1895, the lecture on hot water heating by James Mackay gives information on running circuit mains and the capacity of pipes to carry radiation. Sometimes the area of a 1-inch pipe is considered sufficient for 100 feet of radiation, but under low temperatures of water and long runs or exposed pipe, an area of 1 square inch is better and seems to have been used in determining the size of the circuit main in the plant mentioned. All rules in reference to heating increase in value with the excellence of the judgment with which they are applied, hence the sizes of pipes mentioned will carry the following approximate radiation: A 1-inch pipe, 75 feet; 1¼-inch pipe, 150 feet; 1½-inch pipe, 225 feet; 2-inch pipe, 350 feet; 2½ inch pipe, 475 feet, and a 3-inch pipe 750 feet. With the increase in diameter of a pipe there is a decrease in the surface to lose heat in proportion to the bulk of water carried, so that many fitters use more radiation than is given above. In reference to the plan submitted it is quite probable that the architect has employed some expert heating man to make the plan and specification, as that is a growing custom, and it is possible that as the architect has confidence in his advice he will insist on the letter of the specification and consequently is hardly open to criticism. In the opinion of some successful men it would be wrong to make the high point in the circuit main at A. It should be highest at the boiler and have a fall throughout its entire length until it returns to the boiler of 1 inch in 8 feet, then at the boiler it may drop down and connect at the bottom. In circuit mains the size should be ample—that is, one size

A Circuit Hot Water Job.

larger than would be used on a two-pipe system—in order that the supply of hot water be sufficient to reach the farthest radiator without being greatly chilled by the return water from the intervening radiators. There will never be two currents of water in the pipe if properly run, as the cooler water will fall to the boiler and the hotter water will continue to lose heat and fall as soon as it leaves the high point at the boiler. There may be a sufficient difference in the temperature of the water in the pipe to show very plainly, and it is possible that the colder water will fall or flow freely toward the boiler. Under some conditions it might be possible for the colder water to hold the hotter water in check before reaching some radiator, and by this means interfere with the radiator being heated. The opinions and criticisms of our readers have been invited by our correspondent.

On Wednesday morning a fire broke out in the building of Gillis & Geoghegan, 33 and 35 South Fifth avenue, New York, which entirely destroyed the building and their stock and tools as manufacturing and contracting steam fitters. Their loss is reported to be $75,000, on which there is insurance to the amount of $66,000. Nikola Tesla, the electrician, occupied the fourth story of the building as an experimental laboratory. The cause of the fire has not been traced.

HEATING NOTES.

The Eaton, Cole & Burnham Company, manufacturers of Water, Steam and Gas Fittings, now at 61 Beekman street, New York, are about to move into the Postal Telegraph Building, at Broadway and Murray street. They will have a commodious suite of offices on the fourth floor overlooking Broadway. The secretary, Wm. H. Douglas, in alluding to the new departure said it might be thought to require some courage to do this, but they had found their goods were more and more going into the Hardware trade and this would put them in Hardware territory. This location is a very convenient one, and the company will be in possession of more room than was obtainable in their present quarters.

A defect in the heating apparatus in the Universalist church, says a Watertown local paper, lowered the temperature below 45° Sunday morning, and it was very cold in the building. Rev. Libbey humorously insinuated that he was a stanch Universalist, but that a little fire wouldn't go bad at all just at that time.

The H B Smith Company, 133–137 Centre street, New York, favor us with pocket maps of the States of New York and New Jersey. The front cover proclaims the company manufacturers of steam and hot water heating apparatus for warming all classes of buildings. The back cover shows a cut of their popular Cottage boiler and a list of their boilers, the Mercer, Gold, Mills and Cottage, also their radiators, the Union, Royal Union, Imperial Union, Champion Union, Reed and Whittier direct radiators and the Gold indirect pin radiator. If the maps showed the location of their goods throughout these States, the towns, rivers and railroads would be lost to view.

The Acme Boiler & Radiator Company of St. Paul, Minn., have filed a certificate of amended articles, changing the name of the corporation to the Universal Heating Company.

A London, England, exchange says: "The Lyceum was the first theater in the world to be lit by gas. This was in 1803; but as the audience complained of the odor it was soon discontinued. Now the Vaudeville Theater has won the place of honor as being the first place of entertainment in England to be heated throughout by electricity."

The American Boiler Company will be represented in the State of Iowa by E. C. Molby, who takes the place formerly occupied by J. T. Ryan.

At a meeting of the Board of Managers of the American Society of Heating and Ventilating Engineers held last Monday, B. F. Stangland was appointed chairman of a committee to secure designs for a badge for the society. It was also decided that the board would hold regular meetings at 2 o'clock in the afternoon on the first Monday of each month. A regular date for these meetings was set, so that those who have business which they would like brought before the society may forward their communications to P. O. Box 1818, New York City, prior to that date.

Serrill & Schenck, 39 Cortlandt street, New York, agents for the Webster exhaust feed water heater, are equipping the paper mill of F. S. Field & Co. of Boonton, N. J., with a large size Webster vacuum feed water heater. This will be connected with the dryers,

some of which are 4 feet in diameter and 8 feet in length, steam being admitted to the dryer through the journals on one side and the condensation being exhausted through the journal on the opposite side. It is said that with their system sufficient vacuum is formed to lift the water from the bottom of the dryer through a pipe which reaches nearly to the bottom to withdraw nearly all the water from the dryer. In the past it has been the custom to stop the machinery as frequently as it became necessary, and bleed the dryers of the water which had accumulated by means of a cock. A very material saving is said to be effected by returning this condensation to a hot well, from which it is pumped to the boiler.

CHAS. GORTON of the Gorton & Lidgerwood Company, 96 Liberty street, New York, recently returned from a trip among the steam and hot water heating trade in New England, and reports that the Gorton boiler, both for steam and hot water, has acquitted itself to the satisfaction of all users during the recent cold spell.

HIGGINS & Co , 379 Lexington avenue, New York, are distributing among their patrons a small mirror, on the back of which is their address and the Richmond trade-mark in blue, and the words "Victor steam and hot water heaters" around the outer edge in white letters on a red ground.

EDWARD GURNEY of the Gurney Hot Water Heater Company, Toronto, Can., was a visitor last week at the office of Johnson & Co., 71 John street, New York, who are agents for the Gurney steam and hot water heaters in New York.

ON FEBRUARY 18 P. K. Dealy gave "a plain talk" before the Chicago Steam Fitters' Protective Association on the Williames vacuum system of steam heating. This system is an arrangement of apparatus for drawing the steam and condensation from the piping by suction instead of forcing the circulation by pressure. Exhaust steam is utilized without back pressure on the engine, so that the cost of both power and heat is said to be no greater than the cost of power alone; and when used with appliances in which live steam only is available for heating at high pressure, it is said to be almost equally valuable. It is claimed that with this system better heating has been had with a pressure of 2½ pounds at the boiler than has been previously secured from the same piping under a pressure of 80 pounds.

THE NIAGARA RADIATOR COMPANY of Buffalo, N. Y., are distributing very artistic hangers, illustrating the Niagara radiator. The hanger is composed of heavy cardboard, eyeleted at the top for hanging on the wall. The company are also issuing cards giving all dimensions of the various sizes they manufacture. Their radiating surface is rated as follows: 38 inches high, 7 square feet per loop; 32 inches, 6 square feet; 27 inches, 5 square feet; 21 inches, 4 square feet.

JAMES A. HARDING, whose address is Vineyard Haven, Mass., has severed his connection with the Paul Steam System Company of Boston.

According to an estimate based on actual traffic returns, the *Railway Age* computes that the railroads of the United States paid in wages and other operating expenses $100,000,000 less in 1894 than they did in the previous year.

HEATING ✂ PLUMBING.

NEW WORK AND CONTRACTS.

THE CHARLES H. SIMMONS COMPANY, 72 Market street, Chicago, are to install steam heating plants in the store building of Heywood & Morrill, 272 Wabash avenue, and in the flat building of Perley Hale, 6833 Prairie avenue.

COOK & CHICK, 253 and 255 Kinzie street, Chicago, have the contract for steam heating in the flat building of Dr. Peter Fahrney, 938 and 940 Park avenue.

DURING FEBRUARY the hot water and steam heaters made by the J. H. McLain Company of Canton, Ohio, whose Chicago office is at 58 Dearborn street, were installed in the following buildings in Chicago alone: Two heaters, Newbres Building, 431 East Forty-sixth street; residence J. H. Neill, 4225 Drexel Boulevard; residence W. H. Mahnka, 4227 Calumet avenue; residence John Ott, 630 North Roby street; two heaters residence Jos. Cormac, 680 Ione place; residence S. Mayer, Drexel Boulevard and Forty-third street; residence M. Blocki, Forty-third street; residence S. H. Rosenthal, Indiana avenue; two heaters residence Geo. A. McClelland, Kenilworth; residence Dr. Matteson, 4934 Vincennes avenue. In addition to these they report sold but not yet delivered six Cambridge steam heaters for the flats erected by W. H. Sear at Sixty-second street and Calumet avenue, and steam heaters for the new and handsome Pardridge residence on the South Side. Country trade has been very good also with them. These sales do not include their business in their Oxford perfect blast furnace, which, all over the country, has exceeded their expectations for trade so early in the season.

IN GEORGE W. SCHLICHTING'S residence the heating and plumbing were done by Joseph Dugdale, Bridgeport, Conn. The former is known as the siphon hot water system, which works satisfactory. He also has the plumbing contract for Dr. E. T. Payne's new block and two stores and apartments.

H. C. HURLEY, representing the Buffalo Forge Company, Buffalo, N. Y., has completed the heating and ventilating plant in the Ninth Ward School at Rutland, Vt.

A. W. HUNTER, North Adams, Mass., is putting hot water heating apparatus into Dr. W. E Brown & Son's new sanatarium. Two Perfect boilers are used and there will be 131 radiators in the building.

FREDERICK SCHOLEFIELD, 310 South California avenue, Chicago, is to do the plumbing and drainage in the flat building of E. W. Schan, 1281 Bonney avenue.

PAUL H. JAESCHKE, 72 Centre street, Chicago, has the contract for the plumbing and drainage in the residence of Paul and Albert Dennis, Warren avenue, near Crawford.

PORTER & KLEIN, 100 Thirty ninth street, Chicago, have the contract for the plumbing and drainage in the store building of E. Rice, Forty-seventh street, near Union.

ELLIOTT & RYAN, 272 Fifty-fifth street, Chicago, have the contract for the plumbing and drainage in the building of J. R. Flood, Madison avenue, near Sixty-second street.

BINDER BROS., 132 Lake street, Chicago, have the contract for the plumbing and drainage in the flat building of O. Forgerson, 269 North Robey street.

THE J. W. BROWN PLUMBING COMPANY, 364 Lincoln avenue, Chicago, are to do the plumbing and drainage work in the residence of C. A. Hull, Greenleaf and Grand avenues.

CHARLES C. BREYER, 187 West Division street, Chicago, is to do the plumbing and drainage in the four cottages of W. H. Giesecke, 901 to 907 Elk Grove avenue.

ALEXANDER M. MAYPOLE, 816 West Van Buren street, Chicago, has the contract for the plumbing and drainage in the flat building of J. D. Thompson, 1175 West Monroe street.

T. W. CORBETT, New Haven, Conn., has nearly completed the plumbing of the new Gay apartment building. There are 50 water closets, 46 porcelain lined bathtubs, all with exposed nickel fixtures. J. H. McCormack of Wallingford is putting in a McCormack steam boiler and the H. B. Smith Company's Gold radiators.

ARCHITECT JACKSON has awarded to the Barlow Bros. Company, Waterbury, Conn., the contract for plumbing the alterations to Peter Brooks' house.

THE VANDERMAN PLUMBING & HEATING COMPANY of Willimantic, Conn., have been awarded the contract for piping the new shoe factory at Colchester.

THE EQUATOR STEAM BOILER, made by the Nason Mfg. Company, 71 Beekman street, New York, will be used in heating a five story apartment house for A. Taylor, Brooklyn, and two apartment houses for the Estate of B. A Aycrigg, on Thirty-third street, New York.

MULHERN & PIATTI, 44 East Forty-second street, New York, are installing the heating plant in the fire engine house at White and Elm streets, New York, and in an office building at 89 and 91 Fifth avenue. They have recently completed the heating plant in a 12-story office building, 50 x 200 feet, at 627-629 Broadway. Horizontal tubular steam boilers were used in all of these buildings.

FARRELL & CONATON, Lowell, Mass., have been awarded the contract for plumbing in the insane department of the Almshouse.

THE BOARD OF EDUCATION, Kinsman, Ohio, is contemplating putting a new furnace in the school building in the near future.

A SPECIAL MEETING of the building committee of the Board of Education of St, Louis was held last week to consider the question of heating and ventilation for the new schools to be built this summer. Professor Kinealy's report was read with care by all the members, and, in consequence of it, the fan ventilating hot blast system of the Marquette will be adopted at the following schools at cost given: Columbia, $6000; Charless, $8000; Benton, $6000; Riddick, $6000; Dumas, $8000; Nebraska avenue, $4000. In making bids for this system the firm must guarantee 2000 cubic feet of fresh air per minute for each room. Parties must furnish their own plans and specifications. At the Washington and Ashland School additions it was decided to put in the direct and indirect steam system, as the boilers are still new and could amply supply heat and ventilation. The Green

Lea Place School, a four-room building, will temporarily be supplied with furnaces taken from other schools. The total expense for all heating apparatus will be $44,000. Bids will be received until April 5.

WM. FAUST, Pittston, Pa., has the contract for the plumbing and gas fitting in the Lazarus Block.

MCKEOUGH BROS., Utica, N. Y., have been awarded the contract for the plumbing in the McGarvey Building.

OTTO L. PETERSON, 217 West North avenue, Chicago, is to do the plumbing and drainage in the flat building of M. Oleson, 104 Potomac avenue.

ARNOLD BROTHERS, 507 South Western avenue, Chicago, have the contract for the plumbing and drainage in the flat building of J. Heperlee, 1456 Lexington avenue.

WILLIAM C. BLETSCH, 1216 Belmont avenue, Chicago, is to do the plumbing and drainage in the flat building of M. Crosby, 1538 and 1540 Sheridan street.

FRANK MEEK, 486 West Eighteenth street, Chicago, has the contract for the plumbing and drainage in the flat building of John Charvat, 769 Van Horn street.

ERNST GARNER, 174 Milwaukee avenue, Chicago, is to do the plumbing and drainage in the flat building of H. Oleson, Sheridan avenue, near Cortland avenue.

J. ZIELINSKI, 1014 North Hoyne avenue, Chicago, is to do the plumbing and drainage in the flat building of J. Blase, 1048 Lincoln avenue.

THE ALCOCK PLUMBING COMPANY, 102 Twenty-second street, Chicago, have the contract for the plumbing and drainage in the Methodist Publishing House, 1517 North May street.

NELSON & CEDERHOLM, 87 West Ohio street, Chicago, are to do the plumbing and drainage in the residence of A. Larson, Berry avenue, near Jefferson street.

NOBLE & THUMM 290 Lincoln avenue, Chicago, have the contract for the plumbing and drainage in the residence of H. Orlikowsky, 202 Warren avenue.

GEORGE ECK, 2208 Archer avenue, Chicago, is to do the plumbing and drainage in the residence of J. W. Luse, 6742 Sherman street.

ALWIN W. BAHN, 393 Gross Park avenue, Chicago, has the contracts for the plumbing and drainage in the store building of Frederick Schmidt, Otto and Walsott streets, and in the store and flat building of Henry Riedmayer, Roscoe and Perry streets.

NEILL BROTHERS, 495 Forty-third street, Chicago, are to do the plumbing and drainage in the flat building of Richard Kelly, 5928 La Salle street.

FREDERICK NEUSTADT, 300 North avenue, Chicago, has the contract for plumbing and drainage in the flat building of W. F. Brehm, 220 Seminary avenue.

PAUL H. JAESCHKE, 72 Centre street, Chicago, is to do the plumbing and drainage in his flat building at 516 Evergreen avenue.

RICHARD T. WARD, 1489 West Harrison street, Chicago, has the contract for the plumbing and drainage in the flat building of P. F. Doyle, 1480 same street.

PARK BROTHERS, 79 Dearborn street, Chicago, are to do the plumbing and drainage in the flat building of John Jeffrey, 6214 and 6216 Greenwood avenue.

WELLS & MALLMAN, 134 Centre street, Chicago, have the contract for the plumbing and drainage in the flat building of C. S. Thornton, 7928 Honore street.

JOHN C. GUNDERMANN, 182 North avenue, Chicago, has the contract for the plumbing and drainage in the residence of E. Fischer, Ashland and Grace avenues.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, are to install a steam heating plant for the four store and flat buildings of K. E. Roberts, Cottage Grove avenue, Thirty-first street and Rogelsby avenue. Four locomotive boilers and 600 radiators will be required.

THE CONTRACT for the heating plant for the new Baptist Church building, at Seventh and Fulton streets, Chester, Pa., has been awarded to Harry S. Riley, the West Third street plumber. The plant will cost about $1500.

ALEXANDER WUERZ, Norotod, Conn., has awarded the contract for plumbing and heating his new $20,000 residence to Jos. Dugdale of South Norwalk.

D H. KELLY, Derby, Conn., has nearly completed the plumbing and heating of the Plumb Library, in Shelton. A horizontal Bigelow boiler has been used.

ARCHITECTS BROWN & VON BEREN have a new two family house for Jos. Bowden, Jr., of Stamford. Each apartment will have five rooms, with hot water heat and all improvements, and the cost will be about $6000.

THE EXETER MACHINE WORKS, 32 Oliver street, Boston, Mass., are furnishing Exeter boilers and radiators for the new post office at Lynn, Mass.

THE HIGH SCHOOL BUILDING at Amherst, Mass., is to have a system of heating and ventilation.

IN EXAMINING the City Hall at Detroit, Mich., which is to have a new $6000 ventilating plant, it was found that a soil pipe had been tapped to carry off roof water where the fan drew sewer air through the opening.

EVANS, ALMIRALL & Co., 41 Dey street, New York, are installing a heating plant for the Scovill Mfg. Company, Waterbury, Conn., using Evans' exhaust system of hot water heating.

S. G. RICHARDS, 1454 Broadway, Brooklyn, is installing a heating system in the Broadway Temple, Brooklyn. It will be the plenum system, using a Pride of Brooklyn steam boiler.

PROPOSALS for heating and ventilating Winthrop and Shores streets schools, at Taunton, Mass., will be received at the office of the city clerk until March 23.

JOSEPH C. J. WAINWRIGHT, Brighton, Mass., has been awarded the contract to furnish the heating and ventilating galvanized iron pipes to a large summer cottage, the Cartworld, at Bar Harbor, Maine. The plumbing will be done by Lumb & Mitchell, Boston.

EVERETT J. WINN, Dedham, Mass., has secured the contract to do the plumbing at the new Avery school building in East Dedham.

BIDS for the plumbing in the new barracks being erected at Sackett's Harbor, N. Y., are asked for.

THE CONTRACT for the heating of the new Mooney and Brisbane Building, at Buffalo, N. Y., has just been awarded to the L. H. Prentice Company of Chicago. The radiation is to be supplied by the American Radiator Company, about ten carloads being required.

A STEAM HEATER is to be placed in the Almshouse at Wakefield, Mass.

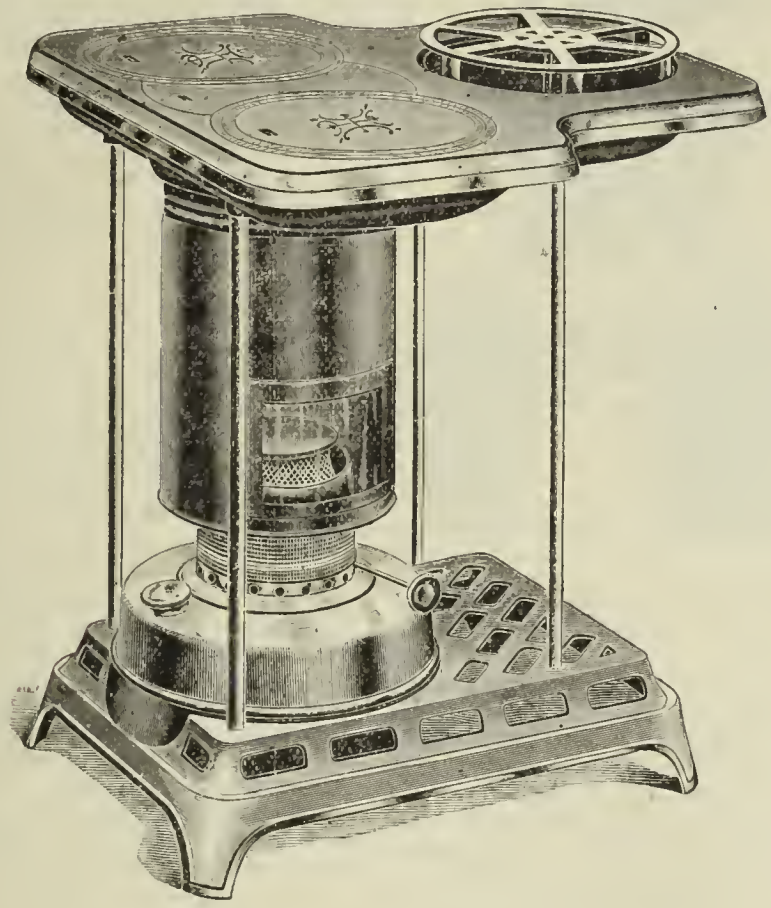
HOLYOKE, MASS., will spend $10,000 in ventilating school buildings.

The returns of the foreign trade of the Dominion of Canada for the six months ended December 31, 1894, show a shrinkage of $6,322,000 in the value of imports, while native exports held their own satisfactorily. The figures are given as follows:

	1894.	1893.
Imports for last six months	$54,572,395	$60,894,062
Exports for last six months	72,599,132	77,604,390

The decline in imports was general in all branches, but a very few articles exhibiting any increase. As regards the falling off of about $5,000,000 shown in the value of exports, the explanation is given that this is due entirely to a lessened shipment of American agricultural products sent through Canadian ports, the shrinkage in value of which was $5 500,000. Home commodities exported show a slight increase, minerals and live stock giving the principal gain in this respect. Timber exports are the only ones that fell off to any extent, being $1,600,000 less than in the last half of 1893. This decline is attributed to the dull condition of the United States market, as Great Britain bought $2,000,000 worth more wood and timber than in the preceding period.

It is expected that the new Atlantic liner "St. Louis," now building for the International Navigation Company at Cramp's Ship Yard, Philadelphia, will be ready to make her maiden trip early in June. The "St. Paul" will follow her consort early in September. These two vessels will be operated on the main line between Southampton and New York in conjunction with the "New York" and "Paris." This will involve several changes in the arrangement of the International Navigation Company's passenger traffic, and only twin screw steamers will thenceforth be operated on the main line.



A certificate of incorporation has been filed in New York by the New York and Brooklyn Tunnel Company, with a capital stock of $100,000. It is proposed to build a tunnel between East Sixteenth and Whitehall streets, New York City, along the most direct and feasible route under the bed of the East River to a point in Brooklyn between North Eighth street and Atlantic avenue. The length of the road to be built is estimated at about two miles. It is to be an underground railroad, standard gauge, and to be operated by electricity or other motive power. The directors of the company are: Thomas A. Patteson, Jr.; Charles J. Schlegel, Walter J. Aims, John C. Bucken, Charles Kuehnemundt, John V. Bouvier, Jr., Frederick P. Delafield, Frank H. Knight and Samuel S. Slater.

A project is on foot to utilize Glen Falls, in Ontonagon County, Mich., in developing electric power wherewith to operate a number of abandoned copper mines in the neighborhood. It is calculated that in the existing fall 4377 horse-power is available, and that it can be increased.

THE RETAIL STORE.

The Ladies' Delight Oil Cooker.

A recent addition to the assortment of oil cookers manufactured by Page Brothers & Co. of 227-233 Cambridge street, Boston, Mass., is the new Ladies' Delight, an illustration of which is presented in the accompanying engraving. This is claimed to be something of a departure in the line of oil cook stoves and represents the results of many years' experiment. The manufacturers feel that in the Ladies' Delight they have the "neatest, most efficient, most compact and easily managed oil cook stove ever presented to the public." From an inspection of the engraving it will be seen that in the top surface there are three cooking holes, each being 8 inches in diameter. The rear one is intended for the reception of the oven, which is of large capacity, being 18 inches long, 14 inches high and 12 inches wide. The makers state that they use the same kind of burner and font as that employed in connection with their Beauty oil heater. Some of the special points claimed for the Ladies' Delight as now made include the following: 1. There is no drawing up of the flame and tendency to smoke. 2. No heating of the oil reservoir, producing what is termed "sweating of oil," necessitating constant care and wiping. 3. No generation of gas from heated oil and liability of explosion and catching fire. The heater here shown is known as No. 10, and the font has a capacity of 1 gallon of oil, which it is claimed will burn from 10 to 12 hours. The tubes and font are of heavy seamless brass, and as the double central draft is embodied in the construction of the cooker, the font remains cool and perfectly safe. The oven used is especially adapted for the Ladies' Delight and is made with extra large side door and double shelves.

The Ladies' Delight Oil Cooker.

Enterprise Raisin Seeder.

The Enterprise Mfg. Company of Philadelphia, Pa., for whom J. C. McCarty & Co., 97 Chambers street, New York, are agents, are introducing another labor saving device which they have named the Enterprise raisin seeder, shown in the accompanying engraving. The raisins, after stemming, are fed into the hopper, the revolving of the crank forcing the raisins between a rubber roller and toothed cylinder, permitting the seeded raisins to drop into a receptacle while the seeds are discharged through a spout. It is said the ordinary washing usually given raisins is sufficient to insure better results than if the fruit is pressed through dry. The family size will seed, it is said, 1 pound of fruit in five minutes, a larger size for hotels, bakeries, &c., having a greater capacity. Both are tinned. The family size is numbered 36, that for hotels 38.

Enterprise Raisin Seeder.

Crescent Automatic Spray and Force Pumps.

The Crescent Brass & Iron Works, Detroit, Mich., are putting on the market the spray and force pumps herewith illustrated. The one shown in Fig. 1 is described as a reservoir pump, with a heavy brass cylinder, an extra large galvanized iron air chamber, 4 x 11 inches in size, and a galvanized iron suction rod. The spiral spring is referred to as being made of heavy spring brass wire, and the valves of non corrosive metal. The saucer shaped foot has a strainer on the top to prevent clogging with dirt from the water. Two nozzles are furnished with each pump, in which a sprayer is adjusted; also 12 inches of good rubber tubing. It is explained that the reservoir may be filled and the pump carried "a-field," and that with the fine spray adjustment the liquid used will last from 10 to 15 minutes; or, if desired, the pump may be made to work as well from a pail. The pump shown in Fig. 2 is designed for bucket use only, but otherwise is similar to the No. 1. It has a galvanized air chamber 2 x 10 inches, a heavy brass cylinder. metal valves, brass

Fig. 1.—Pump No. 1. Fig. 2.—Pump No. 2.

Crescent Automatic Spray and Force Pump.

spiral spring and a saucer shaped anti-clogging foot. The length of the rubber tubing is 12 inches.

Ideal Water Filter.

The Germ Proof Filter Company, 16 Cedar street, New York, have brought out an improved water filter, as shown in the accompanying cuts. Fig. 1 represents the direct filter, known as the Cataract, which is 3½ x 3 inches in size. The top is of cast brass, in one piece and nickeled, as are all the metal parts. Connecting the top and bottom is a perforated hollow metal pipe, which passes through a natural stone filter 2 x 2 inches in size with rounded edges. The top and bottom of the filtering block are made tight with rubber washers, thus compelling the water passing into the reservoir between the filter and heavy outer glass case to make its way through the filtering stone into the inner pipe and so out at the bottom. There is an inside thread cut in the circular rim forming part of the upper cap, by means of which the apparatus is screwed to the permanent faucet. Fig. 2 illustrates the same filter with

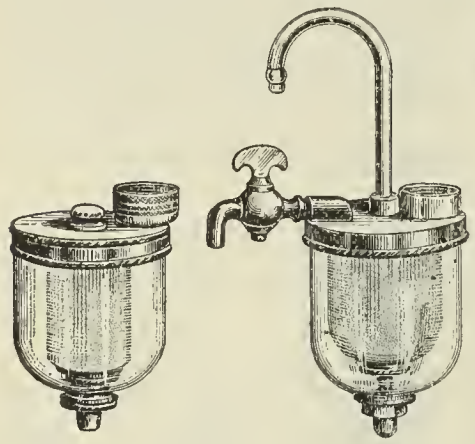


Fig. 1.—Direct Cataract Filter.

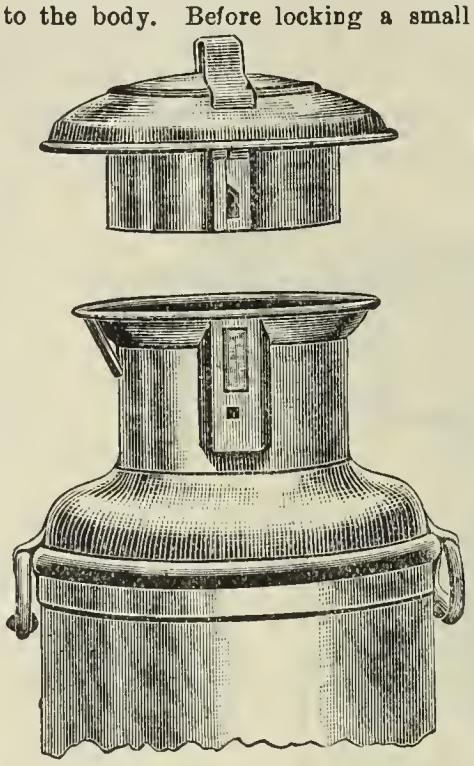
Fig. 2.—Ideal Filter for Filtered or Unfiltered Water.

goose neck attachment and extra faucet. Filtered water is delivered through the goose neck, while unfiltered water passes more rapidly through the faucet seen in the cut. The filtered supply is controlled by the main faucet on the water fixture. The filters are quickly taken apart, when any accumulation of matter can be instantly brushed off the stone block. Underhill, Clinch & Co., 94 Chambers street, handle this article in New York and nearby territory.



Air Tight Waste Trap.

The Baldwin Refrigerator Company, Burlington, Vt., use on their refrigerators a closed waste trap. It is in cup form, with a screw top, having a short pipe passing through the cover and down nearly to the bottom of the cup. This is slipped over the waste pipe of the refrigerator. Near the threads on the upper portion of the cup are openings through which the waste water drips. The trap is made in this form, it is explained, to prevent warm air ascending the drip pipe and to prevent water splashing the bottom of the refrigerator when doors are suddenly closed. The trap can be taken apart for cleaning, and is referred to by the manufacturers as simple and effective.

THE FRANCE SNYDER COMPANY have opened a new stove store at 523 Madison avenue, Covington, Ky. The concern are the successors to the late J. M. McClung, who was in business for many years in that city.

The Evans Protective Milk Can.

We show in the accompanying illustrations the special features of the Evans protective milk can put on the market by Keen & Hagerty, Baltimore, Md. Fig. 1 shows the body of the can with the top or cover detached, indicating the manner in which the cover is locked to the body. Before locking a small

The Evans Protective Milk Can.—Fig. 1—View of Can with Top Removed.

card or seal on which the shipper writes his name is inserted in the lock, and in order to unfasten the top a nail or some sharp instrument must be inserted in the opening of the lock. Doing this breaks the seal and the receiver therefore by examining the seal before unlocking the can is enabled to see at once if the seal has been tampered with and by this means locate the trouble. The cover furthermore has a rubber gasket making it impossible to pour the milk out of the can by upsetting. The features of this lock will be more fully understood by referring to Fig. 2, which is an outline sketch of the lock itself. It is pointed out that the advantages of this device

Fig. 2.—Detailed View of Lock.

are that it prevents tampering with the contents and thus settles all disputes of measurement, quality, sediment or adulteration. It is simple, does not get out of order and requiries no padlock or chain or extra key.

MEMORANDA.

FOOTE & SHEAR COMPANY, Scranton, Pa., have removed their wholesale hardware business from 513 Lackawanna avenue, where it was established 45 years ago, to 119 Washington avenue. They will occupy seven floors 25 x 155 feet in the new Carter & Kennedy Building, giving them more than 27,000 square feet of floor space. The building is fitted with all necessary fixtures and appliances for the transacting of the large business which this firm enjoy. The capital stock of the company has been recently increased. They will continue the wholesale and retail hardware, plumbing, tinning and heating departments as heretofore, but with largely increased facilities.

MCLENNAN & MCFEELEY, hardware merchants, have sold out their Victoria business and have concentrated their concern in Vancouver, B. C.

N. KLEIN of Richmond, Va., issues an announcement under recent date to the effect that on February 16 he admitted W. P. Klein to one-third interest in his business and appointed George Klein his attorney. The business will hereafter be conducted under the style and title of N. Klein & Son, who will assume all liabilities of and collect all outstanding bills due the old firm. The new concern are located at 620 East Broad street and carry a complete line of stoves, ranges, fire place heaters and house furnishing goods. They also give attention to tinning, plumbing and gas fitting.

LEFEBURE & Co. of Chillicothe, Ohio, have removed their store from the old stand to 32 East Second street, where their entire establishment is now on the ground floor. They make a specialty of mantels and grates, and handle a smoke consuming furnace made by the Otsego Furnace Company.

THE AVERY STAMPING COMPANY, Cleveland, Ohio, have been appointed Western agents for the full line of Housekeeping Hardware, Garden Tools, &c, manufactured by C. W. Dunlap & Co. They intimate that with the increased facilities of the manufacturers customers may rely upon the prompt and satisfactory filling of all orders, and state that all inquiries for catalogues, prices, &c., from trade located west of New York City should be addressed to the company at Cleveland.

J. W. GREEN, Canandaigua, N. Y., has bought out the interest of the Canandaigua Tinware Company of that place and will continue to manufacture the improved Queen Cooker and will likewise do general jobbing, plumbing and steam fitting.

THE RINGEN STOVE COMPANY, St. Louis, Mo., issue a neat catalogue relating to the Quick Comfort refrigerators, the merits of which they commend to the trade with perfect confidence. In the introductory pages they speak of the general construction and some of the details are illustrated and carefully described. The casters are shown in this way, likewise the trap. A broken view illustrates the circulation in the refrigerator; then follow the illustrations of the different kinds of hardwood refrigerators, covering some 17 pages. A number of grocers' and butchers' refrigerators are likewise illustrated and so are sideboard refrigerators and ice chests. Tables of sizes and prices are given with the illustrations.

Remarking on the present condition of the anthracite coal trade, the Philadelphia *Ledger* says that the trade continues to show that the companies are practically disregarding all efforts at restriction and are mining about all the output their collieries can produce. They are now going on at a rate which will put upon the market for the current month at least 4,250,000 tons, instead of the allotment agreed upon of 3,500,000 tons.

ROOFING AND CORNICE.

A New Roofing Slate Association.

For some little time past the condition of affairs in the Bangor slate region has not been altogether satisfactory to leading operators, and a meeting was recently held for the purpose of correcting, if possible, some of the existing evils. A movement was instituted which has resulted in the formation of what is known as the Bangor Roofing Slate Manufacturers' Association, the object of which is to maintain a uniform scale of prices for genuine Bangor slate, and to sell direct to the trade, or through the hands of four dealers, namely: Auld & Conger of Cleveland, Ohio; John D. Emack of Philadelphia, and E. J. Johnson & Co. and John Galt & Sons of New York City. The association will issue a card to the salesmen so that the trade will know that no one offering Bangor slate is authorized so to do unless he can show authority direct from the association. The latter have also adopted a certificate which will be stamped with the official seal as a trademark, being signed by the inspector, and will be attached to every invoice that goes out, certifying that car No. is loaded with genuine Bangor roofing slate. The architects of the country will be furnished with a copy of this certificate, and if they will request or compel the party furnishing the slate to produce the certificate, the purchaser will know whether or not he is getting what is called for. This course of procedure has been taken by the association for the reason that Bangor slate is largely called for by architects and to prevent the substitution of inferior grades when Bangor is distinctly specified.

The next best grade of Bangor slate is what is known as the Albion Vein, at Pen Argyl, located 3 miles from Bangor, Pa. The manufacturers in this section have suffered largely by having inferior slates offered as their own, and it is believed that they will form an association similar to that at Bangor, adopting the same rule of sending out a certificate. The best element of the trade has requested some such action as this to be taken so that they can be assured that prices will remain firm and that all will pay the same price for their slate. In Bangor the formation of this association has taken away the petty jealousies and envy that have existed for some time between different manufacturers, and it is probable they will all act in harmony in the matter of lowering or advancing of prices. The manufacturers have adopted a price-list and have made it from 15 to 25 cents a square lower than last year's list. We understand that in the formation of the association mentioned there has been no effort at combination for the purpose of putting up prices, but simply for keeping them at such a level as will pay a reasonable profit and at the same time protect the name of the goods.

In connection with this matter the following, taken from the Bangor *Observer* of date of March 7, will prove interesting:

A meeting of all the slate manufacturers of the Bangor region, the Old Bangor Company excepted, was held last Thursday afternoon at the office of Thomas Ditchett. The outcome of the meeting is of great importance to the people of Bangor. For the past two months a bitter fight in prices has been in progress between the manufacturers, and slate was sold at ruinously low prices. Most of the slate region in the United States felt the bad effects of the strife. We are very glad to be able to state that the end of such a state of things has come. The meeting resulted in perfect harmony of action.

A list of prices was unanimously adopted, although much lower than the list that ruled so long, yet it was apparently satisfactory to all. The meeting had the assurance that the Old Bangor Company would heartily co-operate both in prices and also in the matter of issuing a certificate with each car of Bangor slate in order to protect the trade. This certificate will be issued from the general office of the manufacturers, signed by an inspector appointed for the purpose, whose particular duty will be to see that each shipment of slate shall be as stated in the certificate. The meeting adjourned with the best of feeling and of course every one was jubilant because of the final result. The companies were represented as follows:

American Bangor Slate Company, H. J. Reeder, Conrad Miller, J. E. Long and C. S. Colbert.

Bangor Excelsior, R. S. Brown.

East Bangor Consolidated, S. C. Smith and William Bray.

North Bangor, D. F. More.

Star, Charles Ford and Richard Payne.

Auld & Conger, W. E. Lloyd.

East Bangor Slate Mining Company, S. L. Fisler and James Masters.

Columbia Bangor, Thomas Ditchett.

Sub-Letting in Building Contracts.

Architects and intending builders have recently been in receipt of a protest from the Metal Cornice Manufacturers' Association against letting the different parts of a building to one general contractor. The communication bears date at Chicago and reads as follows:

Believing that the practice of letting the entire work upon a building to one general contractor, the different parts of the work to be in turn sublet by him, instead of letting those different parts direct to the contractors who are actually engaged in the different trades, is detrimental to the general interests of the owners, architects and building contractors, and believing that the practice is increasing, because of the efforts of those engaged in general contracting, while on the other hand, up to the present time, no set of men have taken the trouble to systematically oppose it, we shall herein attempt to present the arguments against it. We will consider how the matter affects the owner, the architect and the contractors for the different trades.

1. *As to the Owner.*—We have never heard it claimed that an owner could get a better or cheaper building from a general contractor than he could by dealing directly with the different contractors, and we do not see why he should. Any one will work at least as cheap for the owner, who has the money, as for a contractor, who often has no capital of his own, and depends upon getting the money from the owner with which to pay his sub contractors; the result frequently being disastrous to the sub contractor, if, through having taken the work too low, or if, through mismanagement, he does not get enough to pay the expenses of his business and his sub-contractors' bills. If, on the other hand, the contractor does have capital invested, so that one can safely do work at as low rates for him as for the owner, then some one must pay a profit on this capital, and that some one must be the owner, who may pay it directly in paying a higher price for his work, or indirectly by getting poorer or cheaper work than he had contracted for. It is good business policy to get rid of the middleman wherever possible, and the general contractor is surely one. It is certainly harder for the owner and more expensive for him to make changes on a building let to a general contractor than where the work is done directly by those engaged in the different trades, as on all changes the general contractor expects and demands his profit. To the owner again: Another and very material reason why work should be let in separate contracts, instead of in one general contract, is that the chances and the rewards to the general contractor of combination or pooling are so much greater that it is much more likely to be done. There are not many general contractors, so that it is comparatively easy for them to get together and arrange things, and the jobs taken as a whole are so large that it is worth while for them to try to make a combination, even if they cannot often succeed.

2. *As to the Architects.*—While we have never heard it claimed that by letting the work of a building to a general contractor the owner would get a better building, or that he would get one for less money, it is frequently asserted that work done in that way is less trouble to the architect and to the owner, and that it can be done in less time if it is let to one contractor rather than to several. When the first of the World's Fair buildings were figured, bids were taken for the entire building and for the several parts. The separate bids were in all cases the lowest, and the work was let and done that way. We have always supposed that those buildings were put up with unusual rapidity, which would seem to prove that to get work done rapidly it is not necessary to let the entire building to one contractor. That letting the work upon a building in separate contracts for the different branches is cheaper than letting it all in one, and that it need not result in slow work, is evidenced by the experience of the Board of Education of this city, who always divide their work, though they occasionally take figures the other way, but always find them higher than the separate bids. We could never see how a general contractor could get his sub-contracts done any more quickly than an owner or an architect could. We could never see what magic there is in a contract made by a sub-contractor with a general contractor that makes it easier for the general contractor to crowd him than it would be for the architect or owner to do it. If it is admitted that an owner is likely to get either a cheaper or a better building, or both, when he divides his contracts as much as possible, is he getting proper treatment at the hands of his paid professional adviser, his architect, when that architect counsels him to let his work to a general contractor, that advice being given, it would appear, for the purpose of saving trouble to the architect? Does the architect's plea that he himself is not paid sufficiently to enable him to give his client the advice that his best interests demand tend to raise the architect's profession in the eyes of his client and the general public? If his present rate of compensation is such that the architect cannot look after the details that he is expected to do where the

work on a huilding is divided, are there not several plans that an architect should adopt rather than advise the owner to let the work in one contract? If the architect is so situated that he or his office force can attend to it, why not let him demand higher compensation from the owner? If that will not do, if the owner will not pay 2, 3 or 5 per cent. more to his architect for looking after these details, why cannot the architect have some contractor or superintendent or clerk of the works take charge of that part of the work on a percentage of from 5 to 10 per cent.? We understand that it has been done. Or, a cheaper method would often he to have the owner hire some one on a salary to look after this part of the work.

The advantage of these two latter methods over letting the whole in one contract is that all the contracts will finally be let hy some one who will have more interest in getting good contractors, in having the work well done than does a general contractor, whose sole interest, or at least his paramount interest, is to get the job done cheaply, and that is the backbone of this protest; that the general contractor has so little regard as to how the work is done; that general contracting breeds and from its nature must breed a class of scamp subcontractors, to the loss of those who want to do good work. It is because we think that the architects take pride in their work and in their buildings and wish to have their buildings well built that this appeal is made to them, that this phase of the matter is presented to them. In the past, general contracting has not prevailed in Chicago as it has in the East, and we think that the present tendency comes from Eastern influences, both of architects and general contractors. We understand that general contracting has been in vogue in the East from colonial days, from before the days of architects, as it were; that in early days there was no architect. The contractor builder was everything; all in all. What power, influence and importance the architect has there now is largely in spite of the huilder. In New York a good many years ago an architect was hardly known. Most of the houses now are built by builders, and architects have little to do with them. The same state of affairs did and does exist at Philadelphia and other Eastern cities, so that the man who builds his own house in those cities is considered to have done something to distinguish him from ordinary people who buy theirs ready made from the speculating builder. The huilder has never heen so important here. The architect has always been more important, and why the architects should wish or even be willing to give up so much of their husiness and responsibility we cannot understand. It is suicidal for them to shirk or to let any one do for them any large part of what they have heretofore done as part of their duty and for which they are paid. It is a very sure thing that whatever trouhle the architect saves he must before long allow for either directly in what the owner pays him for his services or indirectly in the importance of his profession in the huilding world. At present an easy way for the architect or for the owner to ascertain which is the cheaper way to get work done is to take bids both ways—that is, from the general contractor for the entire job and also from the different trades in detail. We are perfectly satisfied to abide by the result of such tests. The general contractors will also probably he satisfied, as at present they are not as strongly entrenched in their position as they might be, otherwise they might take the position that was taken in Philadelphia some few years ago, where the Master Builders' Exchange announced that "members should decline to give estimates in the aggregate for work when the owner or his agent are receiving estimates in detail for the same." At Louisville also the Builders' Exchange adopted rules to the same effect.

When hids are taken hoth ways, it should, however, he understood that hids given to an architect for the different parts of the building are solely to enahle him to let the work in separate contracts; and that to disclose those bids, without the consent of the makers of them, to a general contractor to enable him to take the entire work, is as flagrant a breach of fair dealing as it would be to disclose them to any other competitor. We protest because it increases the cost of doing our business, as we sometimes have to figure five times as often as we should to get the same amount of work direct from the owners or architects. We protest because it tends to poor work, as very few general contractors are nearly so particular as to the quality of work done as they should be, and will let work to the cheapest man, often when they know the chances are against his doing a good job. The temptation to do this is strong. Their interest in the job is solely to make what they can out of it; they will not give a dollar preference for a first class job, where an owner would give ten; all they require is something that can be made to pass. We also protest because so many of the general contractors do not pay their subcontractors as promptly as they should; many of them do not pay nearly as promptly as they get their own money, and some of them refuse to settle with or pay their sub-contractors until long after they have received their own money. The tendency, from our point of view, is certainly to increase the cost of doing business, which must, when things are settled, come out of the owner; to lower the quality of the work, and to make the suh-contractors feel, even the best of them, that it is hardly worth while to do a good joh for an owner who thinks it is not worth his while to make a direct contract with him, or to recognize him in any way. The practice certainly tends to lower the standard of work aud to lessen the pride of the suhcontractor in his work.

Finish for Slate Roof at Ridge and Hip.

From M. A, *Suffolk, Va.*—Will *The Metal Worker* inform me how to make a ridge finish for a slate roof, the same being made from the slate with which the roof is covered, as shown by the inclosed drawings? I tried to put a ridge roll made of galvanized iron on the ridge and hips, but the architect claimed the effect was destroyed. Which is the better finish at ridge or hip, to have the slate lap and use roofing cement, or to have the ends butt together?

Answer.—In Fig. 1 is shown a portion of a slate roof as derived from our correspondent's drawing. The hip finish is made by laying one row of slate with the edges parallel with the hip. To make this finish a hip board, which is about one-half the width of the slate used, is first nailed to the hip, as shown in Fig. 2. This board can be cut on a bevel, being 1 inch thick at the hip and $\frac{1}{2}$ inch thick where the slate joins. The roof slate are then cut on a bevel so as to butt against the edge of the board. Paper can then be put over the boards, when the hip slate are to be laid as shown in Fig. 1, and secured by nailing. Another kind of finish is shown in Fig. 3, the hip slate being of double width, so that for a roof of the pitch shown they extend up the roof sufficiently to allow for proper nailing. If slate of ordinary width were used for this finish, as indicated by the dotted lines in Fig. 4, the slate would not extend up the roof far enough to be nailed. There are a number of methods for making the joints at hip or ridge. For the hip sheet metal caps can be

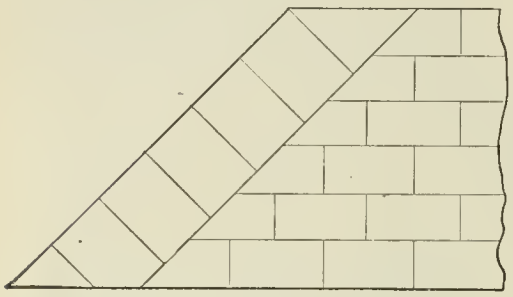


Fig. 1.—The Sketch Submitted by "M. A."

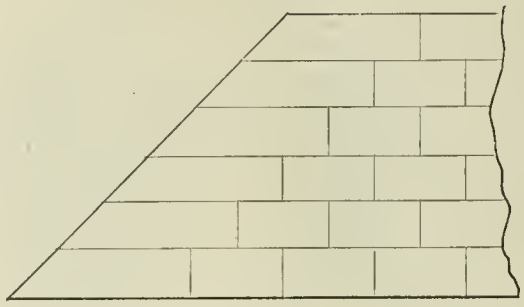

Fig. 3.—Double Width Slate Used at Hip.

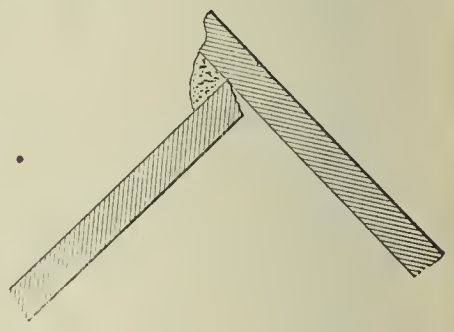

Fig. 5.—Lap Joiut at Ridge or Hip.

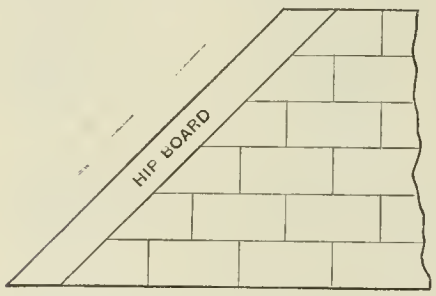

Fig. 2.—Strip of Board Applied to Hip.

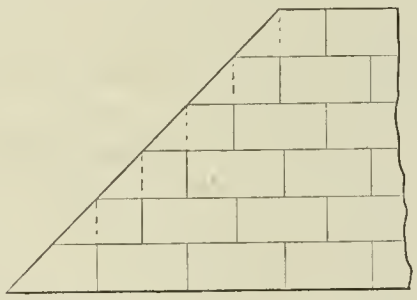

Fig. 4.—Finish Made with Slate of Usual Width.

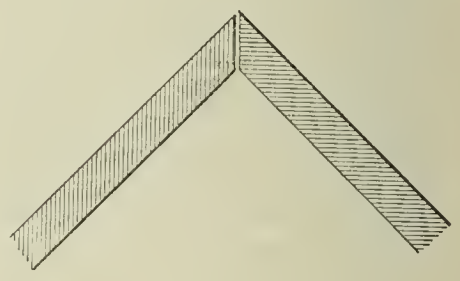

Fig. 6.—Butt Joint at Ridge or Hip.

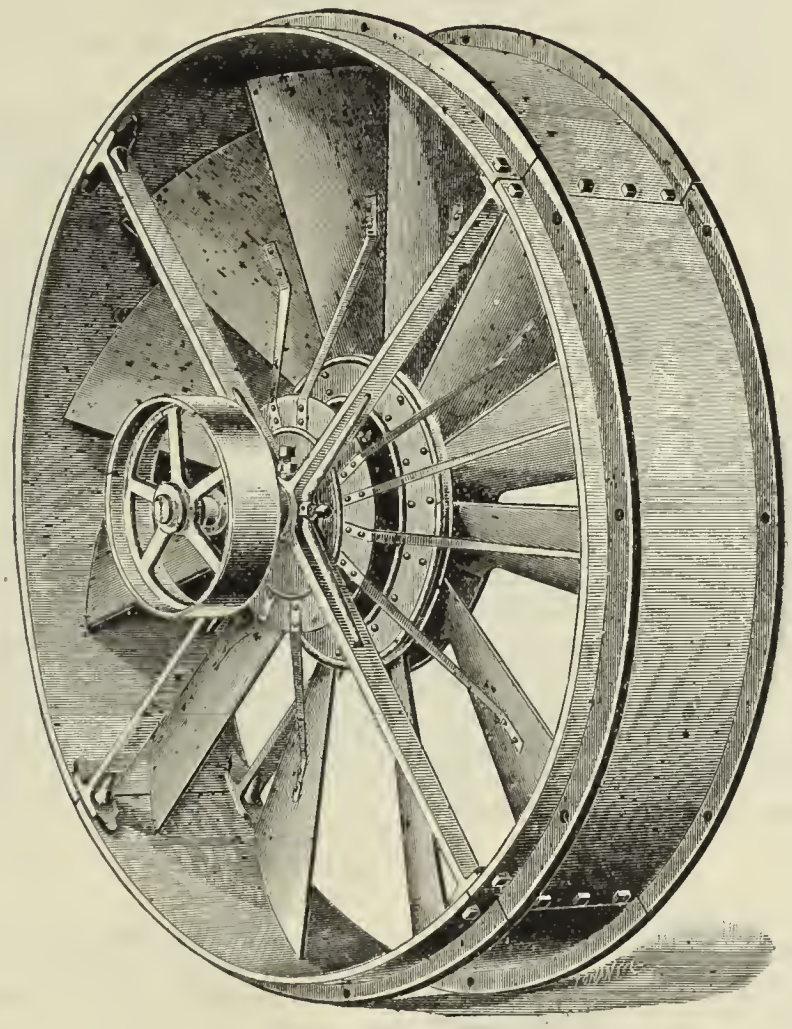
FINISH FOR SLATE ROOF AT RIDGE AND HIP.

placed over the hip joints, being so laid as not to be exposed, but extending up the roof far enough to be nailed and laid with each row of slate. The slate can be laid with butt joints at the hip, as shown in Fig. 5. Another method is to dispense with the caps and bed the hip joints in roofing cement. Lapping the slate, as shown in Fig. 4, and then filling with roofing cement does not give as sightly a finish as is shown in Fig. 5. For a ridge finish the last row of slate can be laid with butt ends, being laid in cement at the ridge. Another method is to place bent strips of sheet metal over the ridge, the strips to extend on either side nearly as far as the last row of slate. After these strips are in position the slate are applied. When finishing without a ridge roll the nail heads can be covered with roofing cement. When making a butt joint, as shown in Fig. 6, the slate are to be cut from the upper side, thus giving the slate a beveled edge.

FLASHINGS.

THE 1895 CATALOGUE issued by the St. Paul Roofing, Cornice & Ornament Company, St. Paul, Minn., contains a great deal of information of interest to the roofing and cornice trade. In an introductory note they direct particular attention to their patent slip joint constructions, the plates being galvanized after they are stamped and thus given a perfect coating. They also allude to their system of remodeling, by which they can beautify an old or unsightly building, while offering, they say, an absolutely dry and warm construction. In the earlier psges a number of samples of galvanized work are illustrated, showing the material adapted to all sorts of buildings of all sorts of architectural design. Fine half-tone engravings, showing the appearance of their rock face plates, follow. The transformation of an old building is likewise shown. The ceiling work comes next, very handsome examples of this form of interior finish being presented. A number of pages are given up to cornices. Metal shingles are illustrated, likewise steel roofing. Toward the close of the catalogue a variety of miscellaneous articles are illustrated, such as conductor pipe, eave troughs, &c. Ridges, hip molding and finials are shown in various styles. Tables of sizes are given wherever called for, and prices accompany the illustrations.

HENRY BEUTELSPACHER, Bridgeport, Conn., has commenced work on his contract for metal work on the new German church at Torrington, and has just completed the plumbing and tinning of Christian Bitzer's new house on Sherman street. He also has a contract for piping, &c., at the Eckart brewery, and has the contract for the metal work and gas fitting at the new Greek church at East End.



THE LOUIS BIEGLER CORNICE COMPANY have been incorporated at Chicago, with a capital stock of $10,000; incorporators, P. L Biegler, T. A. Delamater and F. B. Dickinson.

BEER & HESS have recently removed their cornice shop to more commodious and centrally located quarters at 119 West Thirtieth street, New York City. This move, we understand, was made necessary by the rapid increase in their business and in order to provide better facilities for turning out cornice and skylight work and for executing tin, slate and metal roofing.

A REVISED PRICE LIST for Bangor roofing slate was adopted at a recent meeting of the Bangor Roofing Slate Manufacturers' Association. Particulars of the change will be found in our trade report columns.

The Smith Flanged Ventilating Fan.

Our illustration shows the method of constructing the Smith ventilating fan, manufactured by the Huyett & Smith Mfg. Company, Detroit, Mich., of sizes 7 feet or more in diameter. It will be noticed that the case or rim of the fan is made in four sections, each section being firmly bolted to the fan arms. In order to facilitate the handling of these fans they are always shipped knocked down, or in other words, the arms, shaft and case are removed from the fan. They may be set up or put together very readily by simply bolting the different parts together. The hanger arms are made in sections bolted together at the center, forming a sleeve in which the journal box is secured and made adjustable by means of the four bolts engaging the sleeve with the bearing, as shown in the cut. The fan wheel is put together with bolts, and is also shipped knocked down. The blades of the wheel are provided with braces securing them to the brace disk, which in turn is secured to the fan shaft, thus making a strong, tight wheel. All parts are marked and numbered so that they may be put together without difficulty by any competent mechanic. As these fans are usually built in walls or partitions, they are provided with heavy angle iron flanges, which are firmly bolted to the fan case. These flanges are bored for anchor bolts, which extend clear through the wall in which the fan is placed, thus making the fan perfectly firm.

THE SMITH FLANGED VENTILATING FAN.

The hardness which is lacking in aluminum can, it is said, be imparted to it by the addition of chromium, under a new process just introduced. The method is claimed to render the aluminum as hard as chrome steel.

A new emery wheel was recently subjected to an unusual test by the Springfield Emery Wheel Company of Bridgeport, Conn. The wheel is 14 inches in diameter by 2 inches thick. It was run at a speed of 4000 revolutions per minute, which is nearly three times the usual speed of a wheel of this size. The wheel suffered no harm from the great strain to which it had been subjected.

The insurrection in Cuba is likely to exert a serious effect on the export business of this country with that island. Manufacturers are reported to be unwilling to do any business in that quarter except on a strictly cash basis. The trouble has already caused a falling off in the corrugated iron roofing trade with Cuba. The latest advices, however, point to the likelihood of the breaking up of the insurrection within a short time.

A consular report to the French Government from Cape Town, South Africa, mentions that house furnishing goods of cast and wrought iron and tinware have a very considerable sale in the Cape Colony. Copper kitchen utensils are rarely used. Enameled ware offers the best field.

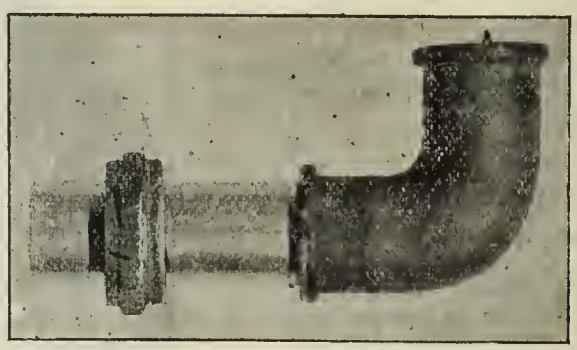
PLUMBING and GAS FITTING.

Growth of the National Association of Master Plumbers.

In reviewing the work of the National Association of Master Plumbers, National President John Mitchell finds that during the present fiscal year 19 local and 5 State associations have been formed, and reckoned from the *per capita* tax already received, represent 283 new members, as follows:

Florida Association	18
Arkansas Association	30
Northampton, Mass	18
Asbury Park, N. J	12
Janesville, Wis	4
Harrisburg, Pa	15
Allentown, Pa	14
Scranton, Pa	21
Individual members	84
Aurora, Ill	6
Bloomington, Ill	5
Joliet, Ill	5
Springfield, Ill	8
Rock Island and Moline, Ill	10
Elgin, Ill	6
Danville, Ill	4
Ottawa, Ill	5
La Salle and Peru, Ill	5
Jacksonville, Ill	4
Mendota, Ill	4
La Grange, Ill	5
Total	283

It will be seen that, as compared with the same period last year, when there was an increase of 158 new members, there is an increase of 125 new members over the increase of last year. State associations have been formed in Wisconsin, Nebraska and Tennessee, which will further strengthen the National Association.

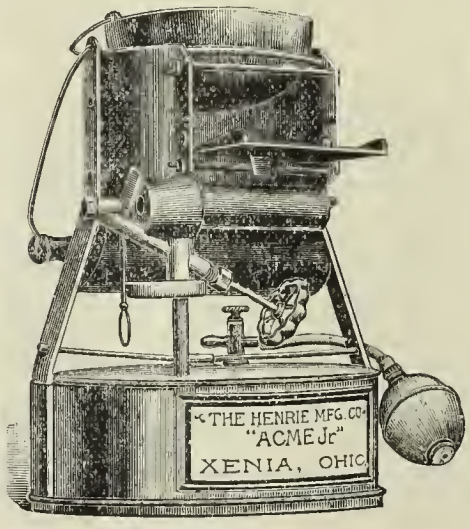


Plumbers' List of Manufacturers.

A year ago last April the National Association of Master Plumbers published a list of all the manufacturers and jobbers of plumbing material who approved the protective resolutions of the association, better known as the Baltimore resolutions. President Mitchell informs us that since that time many firms whose names are not on the list have signed the resolutions, necessitating the publication of a new list, copies of which will be mailed direct to the trade. He further states that several firms have complained of the omission of their names, and in order to afford all an opportunity to have their names especially recommended to the trade he invites all manufacturers and jobbers who approve of the resolutions to send to national headquarters, John Mitchell, 113 Hudson street, New York City, for copies for signatnre The new list will go to press on March 31.

ALFRED WHITE AND BENJAMIN S. COURTIS, Lynn, Mass., have left the employ of the L. A. May Company and formed a copartnership in the plumbing business. They will occupy Chamberlain's old stand on Mulberry street.

The Douglas Rubber Elbow.



The John Douglas Company, 162 to 166 Poplar street, Cincinnati, have just brought out a rubber elbow for use in making tank connections with water closets, which is herewith illustrated. This elbow is fitted on a brass tube with a slip joint connection. A brass sleeve, threaded on the inside and fitted with a rubber washer, is placed on the brass tube referred to. It can be adjusted at any distance desired and tightly screwed in place. This elbow is claimed to insure a full and smooth water passage to the bowl. A 2-inch or vent connection of this description will also shortly be placed on the market. Geo. L. Bottum, 131 Lake street, is Chicago manager for the company.

The Douglas Rubber Elbow.

The Henrie Improved Plumbers' and Tinners' Soldering Furnace.

The Henrie Mfg. Company, Xenia, Ohio, have just brought out the improved furnace especially designed for plumbers' and tinners' use illustrated herewith. They say its construction is such as to be absolutely proof against leakage, the burner being so arranged as to require no packing. A blunt valve is used instead of the needle point, which, it is said, precludes any possibility of the orifice, through which the gasoline passes, from becoming enlarged. The arrangement of the burner is also such as to permit of its being turned in any direction for burning paint, melting a joint or heating objects, and does not require packing to keep it tight. As will be noted, the furnace is provided with an iron vessel for melting solder, &c., or the vessel may be dispensed with and a cover placed in position when it is ready for use as an ordinary tinners' furnace for heating soldering irons. Special claims are made by the manufacturers for its lightness and simplicity, it weighing but 6 pounds and comprises but two parts, instantly separable from each other.

The Henrie Improved Plumbers' and Tinners' Soldering Furnace.

Draining Plumbing Systems.

From G. D. B., *Canfield, S. C.*—We enjoy the letters of inquiry in *The Metal Worker* and the comments upon them very much, and we receive a great deal of information from them that is hard to get otherwise. We in our turn would like to ask our brethren of the colder climes how to arrange a system of plumbing in a residence so that there will be no trouble of freezing up and bursting of pipes in cold weather. Most of the houses here are built very open, with no provision for heating or keeping the pipes warm. In our work we place a stop and waste cock in the ground with a case around it and having a rod running up to a convenient point. The pipes are all graded so as to drain this cock. We are often told, however, that in the North, where the climate is more severe, no such trouble is required, and we suppose that it is because the pipes are better protected. We would like to hear from plumbers on this subject.

CAMP & CRANE, 27 Maiden lane, New York, display in their window several different kinds of shower baths, one being designed for use with the old style lever bath bibbs, a three-way brass piece being used to effect the connection. Rubber hose runs from two ends of the brass piece and connects with the bibbs. From the other end the hose for the shower or spray is connected. In this way the shower attachment may be used in connection with old bath fixtures.

Central Supply Association.

The quarterly meeting of the Central Supply Association, which is composed of the wholesale dealers and manufacturers of plumbers' supplies from Pittsburgh, Pa., to the Missouri River, was held Tuesday, 12th inst., at the Southern Hotel, St. Louis, Mo. There were present 72 members and 13 represented by proxy, making a total attendance of 85 out of a membership of 120.

Morning Session —The morning session opened at 10 o'clock and was devoted to routine business. The report of President Wolff was read and favorably received. The treasurer's report showed the finances to be in good condition, and the secretary reported a number of applications for membership which were favorably acted upon. The association then adjourned to meet at 2.30 p.m.

Afternoon Session. — The principal business of the afternoon session was the discussion of the motion to "request trade papers to discontinue quoting net prices on wrought iron pipe." This motion called forth considerable debate and was finally adopted, and the secretary directed to request the different publishers to abide by the resolution. At 5.30 the association adjourned.

At 6 30 the association sat down to a sumptuous banquet tendered them by the St. Louis Supply Association, after which they adjourned in a body to the Olympic Theater, where the opera "Robin Hood" was the attraction, and where all the boxes and the first three rows in the parquet had been reserved for them. The members of the opera troupe made some timely hits at the expense of some of the older members of the association, which were greatly enjoyed by those present.

The officers of the association are:

President, John F. Wolff, Chicago.

First vice-president, John Walker, Detroit.

Second vice-president, Theo. Ahrens, Jr., Louisville, Ky.

Secretary, Wm. M. Webster, Chicago.

Treasurer, O. F. Felix, Pittsburgh, Pa.

The St. Louis Supply Association is officered as follows: President, W. E. Althaus of the Western Brass Mfg. Company; vice-president, Thomas Cahill of Cahill, Swift & Co.; secretary, Albert Webb of Albert Webb Supply Company, and treasurer, G. F. Detrick of Ripley-Detrick Supply Company.

Eastern Supply Association.

The regular quarterly meeting of the Eastern Supply Association was held at 284 Pearl street, New York, last Tuesday. The following business concerns were represented: J. L. Mott Iron Works, DuBois Mfg. Company, Owen & Salter, Fred Adee & Co., J. Regester & Sons, Jno. Trageser Steam Copper Works, Mayor, Lane & Co., Hoy & Co., Haines, Jones & Gadbury, Curtis & Co., Colwell Lead Company, C. Hoffman, Jr., Eaton, Cole & Burnham Company, McNab & Harlin Mfg. Company, R. M. Wilson, Miller & Coates, Henry Huber Company, Stewart Ceramic Company, Smith & Anthony Company.

President John Reid occupied the chair.

The secretary reported a membership of 30 concerns, covering the following territory: New York, 17; Philadelphia, 6; Washington, 1; Baltimore, 1; Cohoes, 1; Utica, 1; Rome, 1; Trenton, 1; Albany, 1; total, 30.

The treasurer's report showed a balance of $900. The dues of the association were fixed at $10 per year, and it was agreed that the fiscal year of the association should commence March 1, 1895. It was stated that many letters had been received by the association asking who were entitled to recognition as dealers. On motion, it was decided that such queries can be answered only when they relate to its members.

A communication from the Association of Manufacturers of Heating Apparatus was received stating that "the members of this association agree not to exhibit any goods at the meeting place, or spend any money in entertaining the members of the Master Steam and Hot Water Fitters' Association or Master Plumbers' Association, either local, State or National, and that we also agree to discountenance, as far as possible, the sending of representatives to such meetings."

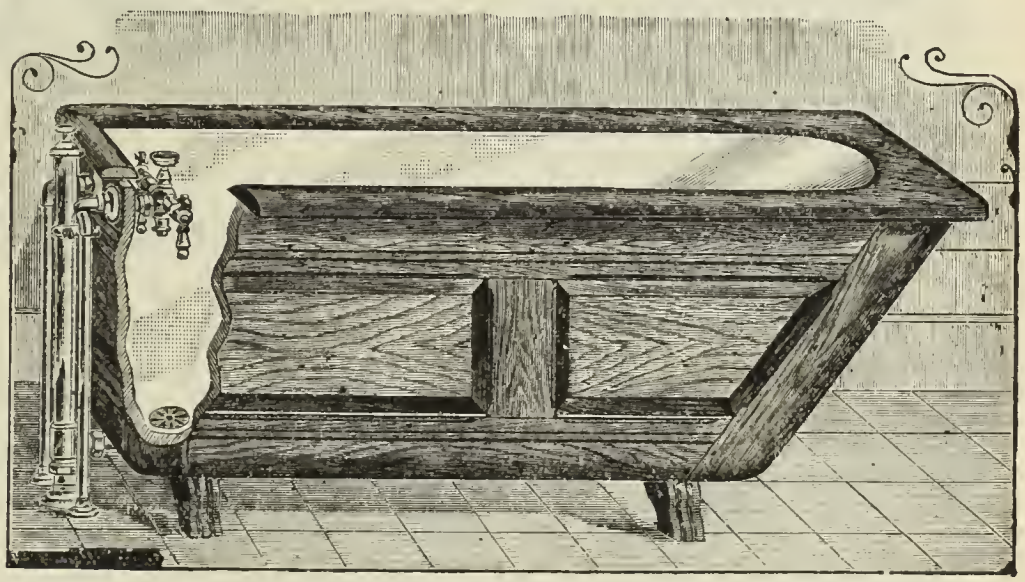
A communication was received from the Willets Mfg. Company, Trenton, N. J., stating that through the solicitation of the Central Supply Association all their ware is now being stamped with their name, and that they are using the iron pipe thread.

President Reid announced as a standing committee on entertainment, Messrs. Hoffman, Douglas and Trageser.

It was also announced that the National Executive Committee is composed of John Clifford, L. D. Lawnin and John Walker of the Central Supply Association; E. F. Souther, L. H. Tillinghast and F. J. Knox of the Plumbers' Supply Association of New England; and John Reid, Jas. E Salter and Henry S. Regester of the Eastern Supply Association.

The following resolutions were then unanimously adopted:

"*Whereas*, It has been customary in the past for manufacturers and jobbers of supplies to have their representatives attend the meetings of the State and National Associations of Master Plumbers, entailing a great loss of time on the part of the representatives and financial loss to their houses; be it



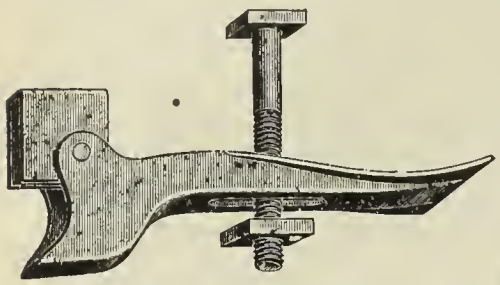
"*Resolved*, That this association discountenance such action in the future.

"*Resolved*, In case a State or local association of master plumbers makes a demand upon any member of this association to confine its sales of plumbing goods in that State or locality to members of said Master Plumbers' Association, such demand shall at once be referred by such member to the secretary of this association. The secretary of this association shall thereupon communicate in writing with the secretary of the Master Plumbers' Association of said State or locality, informing him of the fact that the policy of this association is to adhere strictly to the Baltimore resolutions, and that as the said Baltimore resolutions specifically state that licensed plumbers regularly engaged in the plumbing business, and with an established place of business, are entitled to purchase plumbing goods, this association does not deem it wise or expedient to depart from that rule. In the event of failure to receive redress from the local association, it shall be the duty of this association to again take up the matter and refer it to the secretary of the National Association, and to notify him that until such time as the boycott has been raised the operation of the Baltimore resolutions will cease."

There being no further business the meeting adjourned, and the members then repaired to the Fulton Club to partake of a luncheon prepared by the Entertainment Committee.

Hardwood Bathtub.

The accompanying cut shows a hardwood bathtub which C. A. Blessing, Philadelphia, Pa., has recently placed on the market. With the exception of the copper lining the whole of the tub is made of hardwood. The tub has round corners, molded legs and raised panels, and is fitted with Blessing's all nickel plated Novelty waste and overflow, double compression or Fuller bath bibb and pipes to floor. The tub is made in cherry, ash, oak and maple. Other styles of hardwood tubs are manufactured by Mr. Blessing, having round or square bottoms and corners, turned, molded or carved legs, paneled and plain casings, natural wood finishes, or handsomely painted and decorated, and with and without fittings. All tubs are made in the usual copper weights, 12 to 20 ounces, and in lengths running from 4 to 6 feet. They are also supplied in quartered oak or walnut cases. The tubs are meeting with a good reception at the hands of the trade, and are being specified by architects, particularly for bathrooms where natural wood wainscoting has been used. They are said to be exceedingly durable, and when the linings are worn out they may be easily replaced by new ones.



Hardwood Bathtub.

THE FACTORY of the Victor Company, at Blairsville, Pa., is about completed, and will begin making bathtubs and sanitary ware within two or three weeks.

Sherman's Basin Clamp.

We show in the accompanying illustrations Sherman's basin clamp, manufactured by the H. B. Sherman Mfg. Company, Battle Creek, Mich., and placed on the market through the jobbing trade. Fig. 1 shows the clamp itself, Fig. 2 shows it adjusted to a bowl with thick flange, while Fig. 3 shows

Sherman's Basin Clamp.—Fig. 1.—General View of Clamp.

it adjusted to a bowl with thin flange. The basin clamp proper is made entirely of sheet brass, and from its shape is very strong, while at the same time it presents a neat appearance. One of the most important advantages claimed for it is its adjustability, permitting its use with bowls having either thick or thin flanges, as shown in the illustrations Figs. 2 and 3. In changing the adjustment it will be seen that the plane surface of the clamp offers a flat bear-

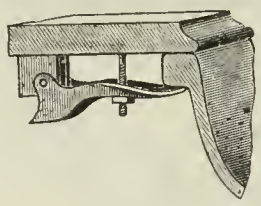


Fig. 2.—Clamp Adjusted to Basin with Thick Flange.

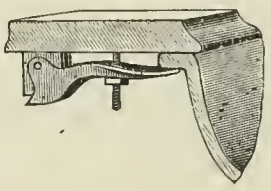
ing for the nut on a bowl to be tightened up against. The variation in the clamp is attained by the little yoke or U-shaped piece, as shown in Fig. 1, being hung out of the center. This allows of four different adjustments by simply turning the yoke with the fingers, and it will be seen that the change can be made instantly. The yoke is attached to the clamp in a substantial manner. Another feature to which the manufacturers allude is the length of the slit provided for the bolt,



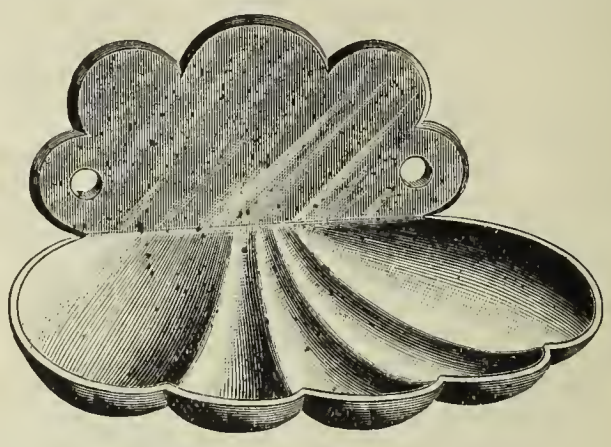


Fig. 3.—Clamp Adjusted to Basin with Thin Flange.

so that if a hole has been drilled out too far for the average basin clamp, as frequently happens with oval basins, the Sherman clamp can be used without trouble. It is pointed out that the adjustments can be made without removing the bolt from the clamp and in a moment's time. The clamp being always parallel with the marble, it is mentioned that it removes the liability of the bolt pulling out of the marble when the nut is tightened up. The Sherman Mfg. Company will send samples of these clamps free of charge on application.

The Columbus Soap Cup.

We show in the accompanying illustration a general view of the Columbus brass soap cup of a special patented design and made by the Columbus Brass Works, Columbus, Ohio. The design of this cup, it is said, prevents the bad odor or collections of dirt from the soap and water, which is a great source of trouble with cups having a false bottom. The cup illustrated can be cleaned by one stroke of the sponge. It

The Columbus Soap Cup.

is made of either polished brass or nickel plated and can be fastened to the back of any washstand with two small screws.

TRAPS AND VENTS.

McCahan & Co., 8 North Central avenue, Baltimore, Md., distribute circulars illustrating and describing some of their gas goods. One of the devices shown is the Surprise gas bath heater; also the Surprise gasoline portable bath heater.

The Gas Fitting Appliance Company, Newburg, N. Y., have moved into their new store at 62 Second street.

George Morlidge has opened a plumbing shop at 633 York street, Newport, Ky.

F. Lenox and A. Cleveland will open a plumbing shop at Hamilton, N. Y.

In *The Metal Worker* of March 9 appeared an article entitled "The Star Coupler on Supply Pipes" and an illustration was shown of the universal application of these couplers. We accidentally omitted to state, however, that they were manufactured and sold by the Star Coupler Company, 801 Wainwright Building, St. Louis, Mo. If the Star Coupler Company were not so well known to the entire trade the omission would have been more serious than it is.

The Western Gas Fixture Company, Toledo, Ohio, had a small fire last week.

The Board of Health of Detroit, Mich., have reduced the salary list of the city officials in their department from $45,054 to $23 300. To do this a number of employees had to be cut off, and several offices were abolished altogether. The number of sanitary inspectors was reduced from 16 to four, and the garbage department was abolished, throwing out the two inspectors and a clerk. Only one plumbing inspector was allowed, at a reduced salary, and no clerk. The office of sanitary expert was abolished, and it was not thought necessary to employ a stenographer. The salaries of most of the offices were reduced. The additions include a sanitary engineer, with six assistants, who will look after the inspection of food, milk, plumbing and sanitary regulations. The office of laboratory expert was also established.

A bill to license plumbers is on its passage through the Legislature of Wisconsin. It provides that no plumber or plumbing firm shall do business without a license, in any city having over 7000 inhabitants. Application must be made to the board of health, which shall appoint a board of examiners to examine into the qualifications of all applicants, and certify them to the board of health, which shall issue licenses good for one year. Fee $2 for employing firms, 50 cents for journeymen plumbers, 50 cents for renewals. An inspector of plumbing is also to be appointed, to be a person not interested in the business. Each city of 7000 or over shall also fix by ordinance regulations for plumbing and apparatus to be used, no plumbing except repairs to be done without a permit. Violation of the law is made a misdemeanor, punishable by fine not exceeding $50.

J. N. Hevey, Keene, N. H., has taken Walter A. Whitman into partnership in the plumbing and gas fitting business. The firm name will be Hevey & Whitman. The business will be increased by the addition of electric supplies of all descriptions.

John B. Kelly has opened a plumbing shop at 42 Front street, Ballston Spa, N. Y.

Thompson & Morrison, plumbers, Amherst, N. S., have been succeeded by C. A. Lusby & Co.

The Birney Plumbing Company have been incorporated at Chicago, with a capital stock of $3000, for general plumbing. The incorporators are C. R. Jones, William F. Henning and C. Woodward.

McCambridge & Co., Limited, Philadelphia, have just issued a handsome supplement of 24 pages to their catalogue B, descriptive of their Sypho closets and urinals. The publishing of the supplement was necessitated by the many additions to the line since the publication of the original catalogue. Many of the styles shown in the catalogue appear in the supplement. A feature of the new styles shown is the method of attaching the seat to the bowl. This is accomplished by means of a solid spindle passing through a sleeve at the back, and forming part of the porcelain bowl. This spindle forms a bearing for the seat mountings, and

makes a safe and durable fastening. The closets are all made of vitreous porcelain and are shown in plain and embossed patterns, with a line of tanks, ornamented and plain, automatic flushing seats, chain and guide pulls, pipes, straps and fittings. Page 11 shows a public toilet room equipped with Sypho closet and urinal. The urinal combination is shown to be of the automatic type, regulated to flush by means of an automatic siphon tank as frequently as desired. The urinal is further described on page 21, and its special adaptability for hotels and public places explained. Page 20 is devoted to Howell's flexible water closet connections, as used on most of the company's closets. Pages 22 and 23 are utilized for detailed pricelists of the different Sypho combinations, and the concluding page is occupied by the company's brass toilet paper cabinet, which commends itself as a finishing touch to the equipment of a modern first class bathroom. The supplement is about 14 x 10½ inches in size, and is bound in buff paper covers.

THE BILL for the registration of plumbers has been again introduced into the British House of Commons in the same form in which it failed of passage last yesr and in 1893. The prospects of its becoming a law in its present shape are regarded as being very remote. A strong opposition exists to it on the part of many ironmongers who combine a plumbing business with their own trade.

E. A. WEIDNER AND J. A. MERGANTHALER have dissolved partnership in the plumbing business at 230 Wells street, Milwaukee, Wis.

THE STOP COCK COMPANY, 50 Cliff street, New York, issue a neat little booklet entitled "Servants or Masters?" relating to an automatic appliance by which both the water and gas supply to a building can be shut off to prevent freezing, overflowing or other accidents occurring during the night.

THE DALTON-INGERSOLL COMPANY, 171 High street, Boston, Mass., are issuing their 1895 supplement to Catalogue "C." It contains 32 pages of fine ensmeled paper and first-class printing. The second page contains a notice that they will keep any of the water closets illustrated in it in repair for three years if they become inoperative through defect in principle or construction. The first 20 pages are devoted to showing their line of hand action siphon closet and their hand and seat action wash down closets. A sectional view is given of all the different closets showing their construction, also a cut of a floor and wall on which the dimensions are given of the space required to set them. Some of the closets are shown all earthen, others with an enameled iron trap. The bottom of the flush tanks for these closets is just level with the seat, and some are shown with the flush tank behind a partition, and it is stated that in public places the run of soil pipe can be shortened by arranging the closets in two rows with an inclosed space between for the flush tanks and piping. The Puritan enameled roll bath is next shown in connection with a combination needle and shower bath. This bath rests directly on the floor, having no feet. It is followed by several illustrations of combination needle and shower baths in connection with bathtubs and separate. Several styles of siphon tank valves and flush tanks are shown and some bath and lavatory combination fixtures.

THE NEW SHOWROOMS of the Gilbert & Barker Mfg. Company, 82 John street, New York, will be heated by a Champion boiler made by the Thatcher Furnace Company, 240 Water street, New York. The salesrooms are being opened to display their machines for the manufacture of gas and gas appliances for cooking, heating and manufacturing purposes, not the least interesting of which is the new Clark's instantaneous gas water heater.

DUBOIS & DARROW, 61 Gold street, New York, are closing out their plumbing supply business previous to entering into a manufacturing business in another field on May 1.

P. J. HART of the firm of Hart & Shea, plumbers and gas fitters, at 10 Putnam street, Fitchburg, Mass., will open a store at 353 Main street, in Central Block.

TAYLOR & HILBORN, Bucyrus, Ohio, gas fitters and plumbers, will remove about April 1 into the audience room of the old M. E. Church, which will be fitted up for their use.

THE WORCESTER MASTER PLUMBERS' ASSOCIATION, Worcester, Mass., in existence for several years, is now a thing of the past. The organization formally disbanded at a meeting held in the rooms of the Builders' Exchange last week. It was voted to pay all the debts of the association with the funds in the treasury, which are ample for the purpose, and then to sell all the association property, which is valued at about $200.

THE PLUMBING FIRM of Leslie & Wilson, West Lafayette, Ind., are moving into the room recently vacated by R. N. Goans' candy store.

GEORGE H. STICHTER, an old member of the Reading Baseball Club, has engaged in the plumbing and gas fitting business at 341 South Sixth street, Reading, Pa.

THE PLUMBING BUSINESS conducted by Harper & Westcott, at 27 Howard street, Albany, N. Y., has been dissolved by mutual consent, and Horace F. Westcott will continue the business. He is president of the Master Plumbers' Association of Albany, chairman examining board of master plumbers, and an officer of the State association.

KINGSLAND & Co., Burlington, Vt., plumbers and dealers in house furnishing goods, have disposed of their stock to the G. S. Blodgett Company and will go out of business.

Death of Alexander McKay.

Alexander McKay died last Saturday at his residence, 136 Canfield avenue, East, Detroit, Mich., aged 42 years. Mr. McKay was well known in business and social circles, being the secretary and treasurer of the Park-McKay Company, manufacturers of plumbers' supplies. He came to Detroit from Dutton, Ont., in 1869, and engaged in the plumbing business with Ferguson, Mouat & Co. At a later date he organized the Park-McKay Company. He was a successful business man. The deceased leaves a widow and two daughters.

It is stated that the International Pacific Cable Company, who failed to get a Federal charter from the last Congress, will go ahead with their project of connecting San Francisco, Honolulu, and Yokohama by cable, operating under a State charter.

News and Notes.

The insurrection in Cuba threatens to interfere seriously with the trade of that island.

During the fiscal year 1893–94 the sum of $3,342,375 was applied by the county and municipal councils in England, Scotland and Wales to the promotion of technical education.

The United States Minister at Madrid, Spain, has reported to the State Department that he has obtained from the Spanish Government an order for restitution in five test cases of claims for excess of duties paid by United States importers into Cuba.

Electricity, according to a Canadian Customs decision, comes under the head of "Unenumerated articles," paying a duty of 20 per cent. when imported into that country. The question recently arose over a proposition to transmit power from the American side of Niagara Falls to adjoining Canadian cities.

The Congress of the State of Nuevo-Leon, Mexico, has recently passed a law exempting from all taxes new industrial enterprises locating in that city in the next two years having a capital exceeding $1000. The exemption is to last six years, dating from the time when the capital shall be deposited.

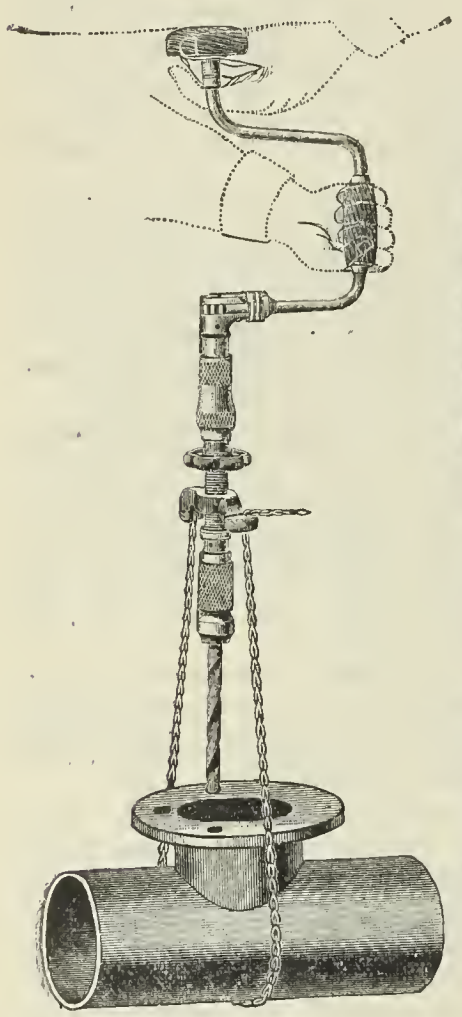
A Philadelphia paper states that the Cramps of that city have a contract to build a 20 knot steel stesm yacht for an unnamed owner, which will be one of the finest pleasure vessels afloat. The dimensions given are 174 feet on the water line and 200 feet over all, with 23 feet beam and 11 feet draft, and 247 tons burden.

United States Immigration Commissioner Stump has prepared statistics showing that during the past seven months immigration into the United States has decreased 40 per cent.

The British Board of Trade returns for February show a decrease in imports of $28,080,000 and in exports of $8,208,000, as compared with those of February, 1894.

The fire losses of the United States and Canada for the month of February, as estimated by the *Journal of Commerce*, aggregated $12,360,200, an increase over the February figures for 1893 and 1894. The following comparative table exhibits the losses for the first two months during the past three years:

	1893.	1894.	1895.
January...	$17,958,400	$10,568,400	$11,895,600
February..	9,919,900	11,297,600	12,360,200
Totals..	$27,878,300	$21,866,000	$24,255,800



The lifting of the acute distress which has for a long time prevailed among the settlers in Western Kansas is evidenced by the fact that 12 counties have notified Governor Morrill that they are in no further need of outside aid.

It is proposed to connect Pittsburgh with McKeesport, West Newton and Greensburg by means of an electric trolley line. The Widener-Elkins syndicate, which controls so many street railroads, is said to be at the back of the scheme.

The explanation of a number of suspicious fires which have been occurring in the east side of New York City was found in the exposure and conviction of an organized gang of "firebugs," who were last week awarded exemplary sentences in State's prison.

The S. & W. Drilling Attachment.

We show in the accompanying illustrations the S. & W. drilling attachment manufactured by the Smith & Winchester Company, Boston, Mass., with New York office at 174 Fulton street. The simplicity of the tool is particularly referred to, and the illustrations clearly show its operation and usefulness. The drilling attachment is used in connection with an ordinary bit brace for the drilling of cast iron, steel, wrought iron or any metal which it is possible to drill by any means. The manufacturers allude to the difficulty of keeping a constant pressure where the brace drill is used. With the S. & W. attachment, however, it is stated that an inch hole can be drilled with great rapidity through metal of any thickness with no power from the operator except the mere turning of the drill. Fig. 1 shows the drill as it would be used in boring through the flange of an ordinary piece of pipe, and indicates clearly the manner of operating the drill. The device is simple in construction and consists of a spindle to one end of which is fastened the drill, and to the other end the bit stock. Outside of this spindle is a tube having threads on the outer side which pass through the yoke to which the chain is attached and which holds the drill to its work. Attached to this tubing is a small corrugated wheel, and as the drill enters the metal the wheel is turned sufficiently to keep the drill at its work. Excessive friction between the tubing and the spindle is prevented by 12 steel balls which reduce the friction to a minimum. Fig. 2 shows the drilling attachment separate as adapted for ½-inch round shank drills, and is classed by the manufacturers as Style A. Fig. 3 shows the same attachment with adjustable chuck for square shank drills and is known as Style B. These drills can be obtained from dealers throughout the country as well as from the Smith & Winchester Company.

The S. and W. Drilling Attachment.—Fig. 1.—Drill in Use.

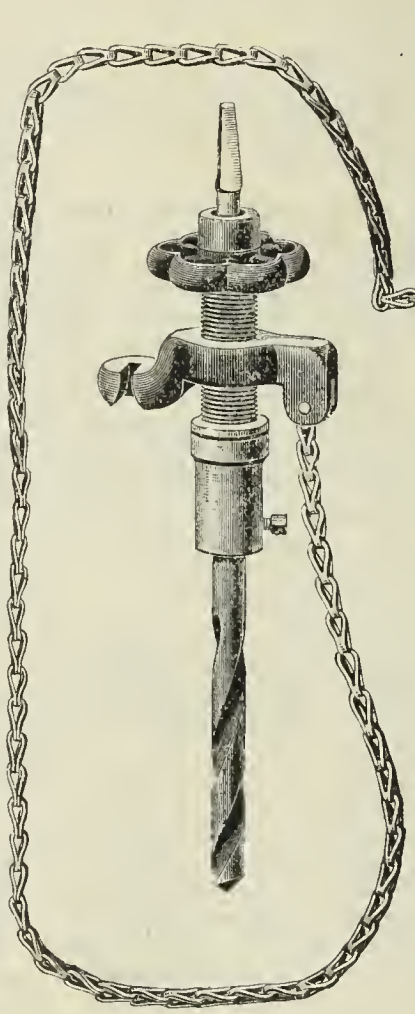


Fig. 2.—Drilling Attachment, Style A.

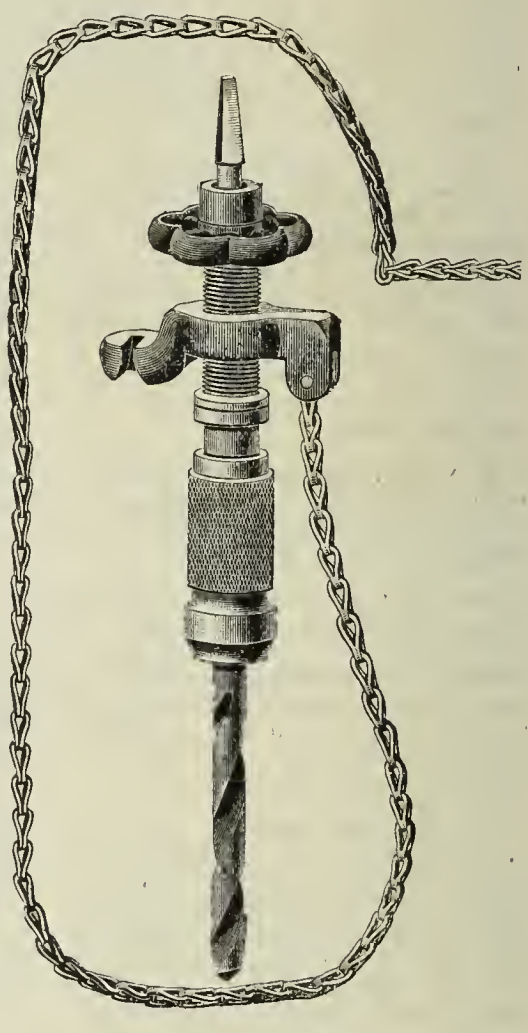

Fig. 3.—Drilling Attachment, Style B.

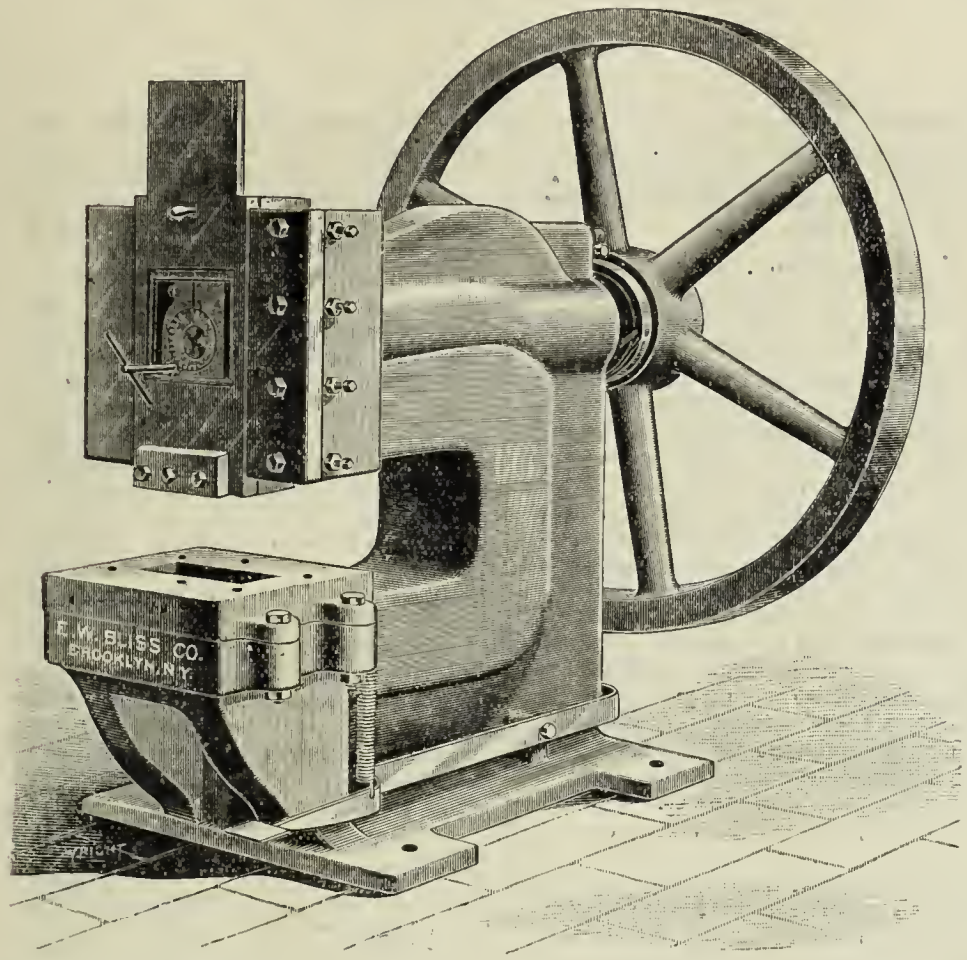
The new ship canal between the Baltic and North Seas is to be opened on June 20 by Emperor William of Germany with imposing ceremonies. A naval parade of vessels of war of all countries is announced as a leading feature of the programme. The canal, which has cost $37,440,000, was begun in June, 1887, and over 8600 men have been employed on the work. It starts at Kiel, on the Baltic Sea, crosses the province of Holstein and joins the river Elbe at Brunsbüttel, below Hamburg. The length is 53½ miles, average depth 29½ feet, width at bottom 72 feet and at water level 213 feet. There will be two locks, one at the Baltic end and one on the Elbe.

At the Charlestown Navy Yard, Boston, Mass., an important test will be made next week of the Ammen ram "Katahdin," to ascertain the vessel's metacentric hight; that is to say, to find out her center of gravity and point of water pressure. The test is regarded as being of the greatest importance, and it will be attended by naval authorities from Washington and representatives of the Bath Iron Works, where the ram was built.

A. B. Howard, Jr., chief of the Maryland Bureau of Industrial Statistics, in his annual report for 1894 shows a total of 7485 mechanical and manufacturing establishments in the State, with a capital of $119,667,316 and employing 107,054 persons. Baltimore possesses 5265 establishments, capitalized at $92,723,677.

The sanitary ware operators, who have recently reorganized for the purpose of resisting any further reduction in their wages, held a meeting at Trenton, N. J., which was attended by operative potters from Baltimore and Ohio, when the constitution and by-laws were adopted, the principal features of which are the obliterating of the individual contract system, fixing a uniform price for each piece of work and prohibiting the manufacturer from taking on any apprentices. The attitude of the men is stated to be very firm on the question of resisting what they consider further encroachments by the manufacturers.



Lloyd's Register of British and Foreign Shipping shows that 22 British war vessels were launched in 1892, of 137,000 tons; 16 ships in 1893, 40,000 tons, and in 1894, 29 vessels, of only 32,000 tons. In the course of the last 12 months Russia launched 34,850 tons of war vessels and France 28,690 tons. Thus France and Russia between them nearly doubled the output of Great Britain last year.

A dispatch from New Haven, Conn., states that the Winchester Repeating Arms Company of that city made a shipment last week of 2,000,000 cartridges to the Chinese Government. The company are now said to be working on a large additional order for ammunition from that quarter.

The Bliss Deep-Throat Power Press.

Up to a comparatively recent period the use of deep-throat punches was almost entirely limited to the punching and shearing required in bridge, railroad and structural iron work, which does not often call for the accuracy and adjustments needed in working blanking, perforating or forming dies on thin sheet metals. Within the last few years, however, much of what had previously been done by hand in the production of stoves, wrought iron ranges, zinc work, &c., has been brought within the range of die operations, calling for a press which combines a deep throat with the necessary accuracy and adjustments. The press shown in Fig. 1 was designed by the E. W. Bliss Company of 11 Adams street, Brooklyn, N. Y., for this purpose.

Its punch slide is guided and gibbed so as to secure accurate cutting and is provided with an eccentric adjustment permitting it to regulate with precision and ease the exact point to which the punch is to descend. The exact nature of this eccentric adjustment is shown in Fig. 2. It can be brought into any needed position by simply turning the pinion wrench shown after having loosened the clamp bolt. The pressure is in this manner always taken on solid metal instead of falling on screw threads. The action of the press is controlled by means of a treadle which operates an automatic clutch, so as to insure the stopping of the slide at the highest point of the stroke. This machine is mostly made as a fly wheel press, but for work requiring a slower and more powerful action it is provided with back gearing. It is also frequently furnished with stay rods so as to fit it for heavier work where a great depth of throat is not needed. The principal dimensions are as follows : Depth of throat, 24 inches ; distance from bed to top of throat, 9¾ inches; motion of slide, 1¼ inches; size of bed, 16 x 16; standard opening in bed, 8½ x 8½; diameter and face of fly wheel, 54 x 5; weight of fly wheel, 900 pounds; speed of fly wheel, 90 revolutions; the complete weight of press, approximately, 5500 pounds.

The Bliss No. 78 Deep-Throat Power Press.—Fig. 1.—General View of Press.

The most destructive natural gas explosion in the history of the Indiana gas belt occurred at Anderson, Ind., at an early hour on the morning of March 5. An entire business block, situated on the Court House square in the center of the city, was literally blown to pieces, causing a direct loss of about $400,000. No satisfactory explanation as to the cause of the explosion is given. Fire followed the shock, but was kept within the limits of the wrecked block.

Paper Water Pipes.

The experiments with the new paper pulp pipes, which are made on pretty much the same principle as the fiber pail, have demonstrated to the satisfaction of the *Paper World* that the idea will eventually prove successful. As it now stands, the hand made pipes, formed from crudely worked and irregularly subdued pulp, are not very attractive in appearance nor well enough made to warrant that they will stand the wear and tear to which street water pipes are subjected. However, it would be more of a wonder if the plan of making the water pipes should be a booming success from the start. Time and experiments are essential to the development of all new things. With each new test of the proposed pipes a step in advance is made, and this would seem to indicate that after a few more trials perfection will have been attained. The matter as it now stands is about as follows: Paper pulp, in which there is a fairly good fiber, is agitated with water and run into molds and cast into the form of the ordinary water pipe. The same molds that are used in connection with casting iron pipes are employed. The mode of procedure is substantially the same. Of course there are various strengthening materials compounded with the pulp, otherwise it would not stand a great pressure. The inventors report that these ingredients are inexpensive and simple.

Owing to the largely increasing Pacific Coast traffic of the port of San José, Guatemala, the Government of that republic, says the Bureau of the American Republics, is taking steps to re-establish the old port of Istapa, situated about six miles from San José. It is proposed to construct a harbor there capable of accommodating about 100 vessels, and also to build a branch railway to the port from some point on the Central Railway, thereby relieving the condition of congestion which now prevails in the neighboring port.

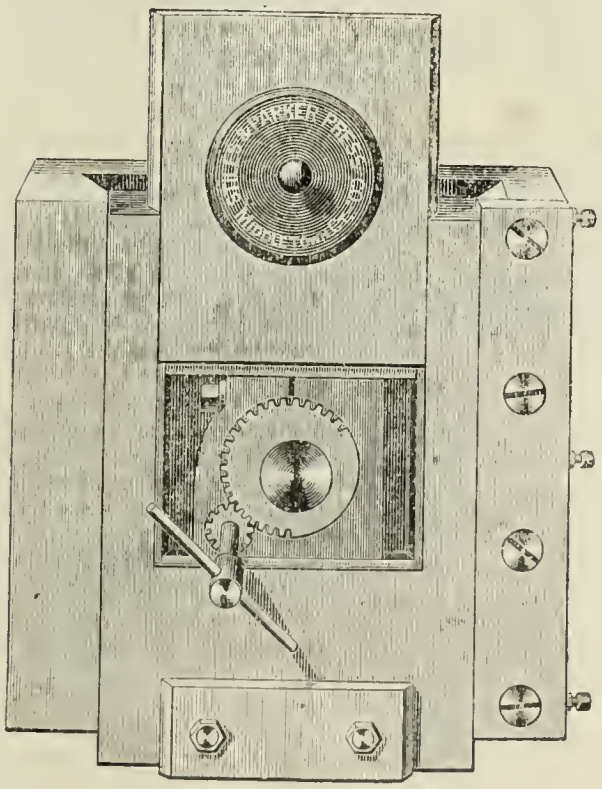


Fig. 2.—Eccentric Adjustment.

TIN PLATES.

SCRAP.

A DISPATCH from Alexandria, Ind., to the Cincinnati *Commercial Gazette* states that a tin plate factory is to be erected in that locality which will employ about 400 men. The plant is to be on a large scale, covering 216,000 square feet.

FOLLANSBEE BROS. COMPANY, successors to James B. Scott & Co., Pittsburgh, Pa., issue a seasonable circular with the rubricated head-line, "Spring is here." This prefaces the cheering statement that signs point to an improvement in business. The purpose of the circular is to call the attention of the trade to the various well-known brands of tin and terne plates which the firm handle. These include Scott's Extra Coated, Triumph Old Style, Orbit Old Style, Duquesne, Neville, Pittsburgh and Raymond roofing plates, and Blairsville best bright, Clifton, Conemaugh and furnace bright plates. Attention is also directed to their assortment of sheet iron and their stock of tinners' tools and machines.

REPORTS of projected tin plate plants are constantly being published, particularly in connection with various towns in the Indiana gas belt. While some of these are undoubtedly *bona fide* enterprises, we are advised that others are being promoted merely for the purpose of booming town lots. These items of news should therefore be taken with a certain amount of caution.

THE recent labor difficulty in the American Tin Plate Company's works, Elwood, Ind., when 50 men in the cold roll department struck for a change in the system of payments, has been adjusted by the company granting the request of the men, and 750 hands are reported to be now at work.

PLANS are reported to have been completed for a third tin plate plant at Ellwood, Ind., to be built by Chicago capital. Work will be begun on the buildings about the middle of April and the plant is expected to be ready for work by October. About 300 men are to be given employment at these works.

BRITISH CONSUMERS are complaining, through the columns of their trade journals, that while the prices of tin plates for export are lower now than at any former period, they are called upon to pay as much for their plates as they paid a year or two years ago, notwithstanding the fact that steel bars and pig tin are both considerably cheaper now than they were at that time.

N. & G. TAYLOR COMPANY'S tin plate plant in Philadelphia is reported to be working steadily, not having been affected by the ups and downs of the trade. The demand for their standard brands is such as to oblige them to increase their facilities. The firm, we understand, are now completing the erection of two new stacks, which they expect to have working within a week. Notwithstanding the exceptionally hard winter, which has its effect upon tin house work, the Taylor plant has been running steadily, with the assurance of a good business for their goods the coming season. The company advise us that their genuine Taylor Old Style roofing plates are increasing in sale, as the old roofs covered with this brand testify to its durability.

E. E. ERICKSON, Pittsburgh, Pa., has a contract to erect a new tinning stack for the Pittsburgh Tin Plate Company, New Kensington, Pa.

THE WELSH TIN PLATE MANUFACTURERS seem to be still hankering after an agreement whereby they can arrange to materially advance the price of tin plates. The *Iron and Steel Trades Journal* of London intimates, however, that it is the owners of tin plate works in Wales, who are also interested in American works, who are endeavoring to entice the Welsh makers to combine to raise the prices. There is, however, a strong feeling against those who have these dual interests, and the Welsh makers are, on the whole, inclined to agree that their best friends are not those who are interested in the American tin plate industry.

THE BRITISH BOARD OF TRADE RETURNS for February show that 33,000 tons of tin and terne plates were exported from Great Britain during the month. Of this amount 23 000 tons were shipped to the United States, against 18,000 tons in the previous month and 13,000 tons in January, 1895.

THE FRANK-KNEELAND MACHINE COMPANY, Pittsburgh, Pa., manufacturers of iron and steel works machinery, have received a contract from Reeves Iron Company, Canal Dover, Ohio, for four double tin mills with 24 x 30 inch rolls, four cold mills 22 x 34 inch rolls, two doubling and one trimming shears.

THE PLANT of the Crescent Sheet & Tin Plate Company, Cleveland, Ohio, is nearing completion and is expected to be ready for operation about May 1 next. At the start out the concern will make black plates, although a tinning department will be added later on. The plant will cost, when completed, about $150,000, and is expected to turn out about 20 tons of black plates per day. The hot mill will be 175 x 75 feet, and will be driven by two engines, 34 x 72 inch. There will be a 10-ton and a 5-ton electric crane and other machinery, including a dynamo. The tin house will be of steel construction, 105 x 165 feet, with a wing 48 x 48 feet. It will contain ten tinning stacks. The annealing house, with pickling machines and other equipment, will adjoin it.

THE tin plate manufacturing firm of Griffiths & Cadwallader, Pittsburgh, Pa., have been dissolved, and the business is being continued by C. W. Cadwallader.

THE NEW PHILADELPHIA IRON AND STEEL COMPANY, New Philadelphia, Ohio, manufacturers of black and galvanized iron and steel sheets, are making important improvements in their plant. Until the middle of January this concern were operating four hot sheet mills with a large Corliss engine, which worked satisfactorily when rolling iron sheets with 22-inch diameter rolls. Large orders for steel sheets of the finer gauges have constantly been coming in, and the firm have decided to double their power, and are now putting in a pair of 32 x 48 inch Geo. H. Corliss engines, a new and heavier fly wheel, two sets of steel gear wheels, a set of 24-inch rolls, and will considerably increase their cold rolling capacity. The New Philadelphia Iron and Steel Company have six hot sheet mills, two cold rolling mills, bar mill and galvanizing plant. Two of the sheet mills and the bar mill are running right along, and will be kept in operation during the time the improvements and repairs are being made. They are operated by a pair of poppet valve engines. An electric crane and lighting plant are also being added. When the improvements are completed, which is expected to be about May 1 next, the plant of this concern will be one of the best equipped in the country, and when running to its full capacity will be able to turn out about 1400 tons per month of iron and steel sheets from No. 12 to No. 30 gauge and suitable for all purposes.

A NUMBER OF IMPROVEMENTS have recently been made in the plant of the Falcon Iron & Nail Company of Niles, Ohio, manufacturers of iron and steel sheets. A continuous rolling mill has been added to the equipment.

THE STAR TIN PLATE COMPANY, Pittsburgh, Pa., have made application for a charter of incorporation. The incorporators are: James Hemphill, William Wade, Pennock Hart, William F. Dutton and Joseph Fawell. The plant of the new concern will be located on Twelfth street, below Penn avenue, Pittsburgh, Pa. The foundations for the hot mills have been under way for some time and are almost completed. The concern will erect eight hot mills and they will be driven in pairs. Three pairs will be driven by 42 x 60 inch automatic cut off engines and the other two hot mills will be driven by a 28 x 48 inch Corliss engine. There will be six cold mills, and these will be driven by a tandem compound engine with 28 inch high pressure cylinder, 50 inch low pressure cylinder and 60-inch stroke. There will also be the necessary annealing furnaces, shears, pickling vats, &c., and it is expected to have the plant in operation on the manufacture of black plates for tinning purposes about July 1, with a capacity of about 50 tons of black plates a day. It is the intention of the firm to add tinning sets later on and to engage in the manufacture of both tin and terne plate.

H V. B. NASH of the tin plate firm of T. B. Coddington & Co., 27 Cliff street, New York, left for Europe last Saturday on business connected with the estate of his father, the late Henry Nash of Liverpool, whose sudden death was recorded in these columns last month. Mr. Nash expects to be absent for about a month.

THE MONTHLY STATEMENT of goods in bonded warehouse in New York City shows that 66 940 boxes of tin plate were so held there on February 28, as compared with 76,353 boxes on the same day last year.

STOVE TRADE NOTES.

Foundry Mixtures for Stove Castings.

The most economical and serviceable mixture of irons is the great point sought by the foundry manager. In this matter experience is worth a great deal, but the experience of any single manager is not nearly so instructive as would be the experience of many msnagers combined. In the hope of securing information from some of the practical men connected with foundry management we print below a letter recently received from a stove manufacturer who has had trouble with his foundry mixtures. The difficulty may be due to the proportions of different irons which he has used. We know that he would be much indebted to any one who could suggest wherein the difficulty lies, and we know the trade would be greatly interested in a discussion of the proper mixtures for stove castings. We print his letter as it is received:

We send herewith a mixture of iron which we have been using without good results, and we would be very glad if some of your practical readers would suggest a remedy. The mixture is as follows:

Thirty-nine per cent. of the pig iron charge is good grade No. 2 Southern Foundry.
Thirty-eight per cent. of the pig iron charge is good grade No. 3 Southern Foundry.
Sixteen per cent. of the pig iron charge is good grade No. 1 Southern Soft.
Seven per cent. of the pig iron charge is Jackson County Silvery, carrying 8 per cent. silicon.

As a matter of course, all of the Southern irons are of different brands. By that we mean they come from different furnaces. With the above we use our own scrap, and with each ton of iron charged we add 30 pounds of limestone as flux. This mixture makes an iron that hss a great deal of dirt in it, and aftcr the iron is melted and in the ladle there is a quantity of dirt that rises and has the appearsnce of rust. It is not slag; it simply resembles rust, and it is impossible to skim this away, for as fast as one lot of rust is skimmed there is another lot which takes its place. When the iron is poured and any of this rust gets in the mold the result is a rather mean appearing casting. I would like to know what to do to clean this iron and to do away with this rust dirt.

AN INTERESTING FIGURE passed away this week in the person of John L. Gill, one of the pioneers of the West, who died in Columbus, Ohio, at the age of 90 years. In the year 1827 he took four six-horse wagon loads of stoves to Athens. On the trip he observed a blacksmith using coal which, on inquiry, he found to have been dug from the adjacent hills. Gill made arrangements with the blacksmith to dig sufficient coal to load the teams on their return trip, which coal he sold on arrival at Columbus at the rate of $15 per ton. This was the first coal ever brought to Columbus for manufacturing purposes from the Ohio Valley, and was the beginning of the immense coal industry of that region.

Gasoline Stoves.

The gasoline stoves that are being marketed this year are more attractive in construction than formerly, and now that their operation is simplified and their use is fully understood it will not be surprising if the year closes with the announcement of the same increase in sales as has been customary. The intense heat of which they are capable has been very pleasing to the always busy housewife, and their efficiency is reported and witnessed with an interest that makes the possession of a gasoline stove a mere matter of time in numberless cases. Like all apparatus of high power their misuse is capable of destruction, but modern improvement has reduced the danger to a minimum. As a farmhouse and suburban apparatus for summer use its popularity is undivided in many sections. Some discouragement has been met through the insurance companies, but liberal and up to date business companies will include the right to use gasoline stoves of approved construction in their policies. The season for their use is not so far removed that the live dealer can put off selecting his line, and the outlook is far more promising than for the past few seasons.

Brand's Catalogues.

The Brand Stove Company of Milwaukee, Wis., and 77 Lake street, Chicago, have just issued two handsome catalogues, one referring to oil and gasoline stoves, oil snd gas ranges and oil heaters, while the other treats exclusively of furnaces. The goods enumerated in the first catalogue cover Brand's Famous gas range, which is made in two sizes and is constructed entirely of cast iron; Famous Junior gas stoves and hot plates with one, two and three burners; Famous oil ranges, with four 8-inch cooking holes; Famous oil cooks, with one, two and three cooking holes, in various styles; lamp stoves with one, two and three burners; Famous All-Right oil heating stoves in three styles and sizes; Famous gssoline stovcs, comprising low juniors, high juniors snd high juniors with step, all having individual burners, and the same styles with single generators, either with stationary, safety or laydown tanks. It will be seen from this statement that the company are well equipped to supply the trade with hot weather cooking apparatus.

Their furnace catalogue illustrstes and describes a larger line of warm air furnaces than ever before shown by the company, to which they have added combination warm air and hot water heaters. Their furnace department has now been expanded into a specialty. The construction of the company's well-tried Wisconsin csst iron furnace is fully set forth, followed by the new construction with steel radiators, and a large number of wrought iron cylindrical flues to increase the heat radiating surface. Another new series of furnaces is named the Famous Florida. This is a base heating furnace with a steel dome and low radiator, increasing the distance traveled by the products of combustion, and securing the utmost amount of heat from the fuel burned. Other furnaces shown are the Famous Comet, with steel dome. and the Famous Magnet for wood. An illustration is given of Bigley's patent hot water heater, designed for the conversion of warm air into combination furnaces. This hot water heater is cone shaped, sits on top of the fire pot, is made of csst iron in two pieces, and presents the appearance of open pipe work, the interior being arranged with partitions between heads so as to cause reverse circulation of the water passing through the heater. It is tested to 150 pounds pressure, hss two inlets and two cutlets, and is intended to add to the heating capacity of a furnsce with little additional expense for fuel.

Florida as a Market for Heating Stoves.

BY JEEMS.

I was down in that flowery land during what they call the "second freeze," and part of the time was domiciled in one of those lovely Southern houses filled with all the Southern appliances for keeping warm, or, at least, for keeping out the warm, and in doing the latter the house was a perfect success. No warm ever got near that house, for the air froze before it struck it, and came into the rooms in regular ice chunks. I always was, and ever will be, the lover of a good stove, and when you have got the institution glowing on a cold day, and you feel its genial warmth while the wind howls outside and the pedestrians buck along against the blast, you feel how much you are thankful to the thoughtful stove man.

I never before had such a chance to enjoy the luxury of an open fire—the pretty tile, the tasty mantel, the finified brass trimmings and then the cheery blsze, as they called it. Great Scott! I bet I had a blaze in that chimney 40 foot high. Me and another nigger took regular watches to see that the cheery blsze was kept up. We had a dead sure thing on the blsze, but the heat we got out of it had no effcct on this "second freeze," as the fire froze from its effects.

Standing with my back to the fire, and clad in a long ulster, I had to tie a sash weight to the tail of the ulster to keep it out of thc blaze, the suction was so strong. How I did long for the stove around the boss' shop!

The reputation of Florida as a winter resort, free from all the rigorous accompaniments which attend the sort of weather that the North gets during the period that the stove men reap their harvest, I should imagine is rather shaky.

There ought to be a big business done in stoves through Florida next winter, for if ever a people needed them the inhabitants of this sub-tropical region do; and if a lot of hustlers started a house-to-house canvass and expatiated on the great advantages of the good old stove and the danger of freezing to death if they have another freeze, a tremendous business could be done. Every orange tree, or at least every three trees, ought to have a stove all ready to light when the sub-tropical winter sets in, for the truth is a sub tropical winter is a corker and not favorable to the orange crop; but with the stove attachment orange growing would be a success. The sub-tropics is the outlet for the stove surplus. Think of it! There must be a million or two of orange trees, and a half million of people who need stoves—that's about the size of it—and there is at least a million stoves wanted. "There's millions in this scheme" for stove foundries and a big field for the inciters of public interest in them.

The sea trip from New York is a very pleasant one when it is "smooth all the way down just like the North River." When it isn't, and usually it isn't, it is not so pleasant. It is like fishing; "if you had been here yesterday you would have struck luck," so the boatmen tell you. So with the steamer—"last trip was as smooth as glass, but this is the worst we ever had." So you take the chances on the briny, but as a mine of information on diseases and oranges the Florida steamship is the place to acquire instruction. Most of the passengers are going down for their health or to look after their orange groves, and between pukes, if they are seasick, they will load you up with a detailed account of their ailments or give full instruction regarding orange growing. It is really delightful to get into one of the medical groups and hear of the wonderful remedies and the cure alls that are recommended; then the doctors' bills; how much each has paid and how good or bad their doctor is, &c., &c. It is so pleasant to hear people describe all their agonies and what they endure, and it is astonishing how they will prolong the narrative to make it interesting for you. It is about as amusing as the dentist when he is running a machine shop in your mouth. Then they all have their prejudices as to the healthiest districts in Florida, and I should judge by what I heard that 300 or 400 yards difference in location would kill or cure a person, according to how he struck it.

The orange fiends are just as bad, for their ideas differ largely regarding this fruit and the best method of culture. As I had no disease or orange groves, and in fact don't care about either, I escaped from the crowd as much as possible, and made friends with the cook, getting points on his art when the weather was smooth.

But there is one thing to be said for Florida, and it applies to the South generally. People who will take Northern comforts and fit themselves for unpleasant weather can be as comfortable as they could wish, and while tropical agriculture may not be a sure thing (except with the stove attachment), other crops can be made. Up around Quincy and Tallahassie tobacco raising is carried out on a large scale. The Owl Cigar Company of New York have some 1800 acres of land at the former place, and are raising a fine grade of tobacco. They have a large cigar factory and heavy capital invested in the enterpise. Fuller's earth has been found by them, and is being mined and shipped North. This earth has always been imported, and no doubt exists but what there is lots of it in Florida. The climate is healthy, soil good, ground high and rolling, good water and living and land cheap in this section. Eggs 15 cents per dozen, chickens 25 cents, turkeys 75 cents each, dressed hogs 6 cents per pound, &c. Quincy has just contracted for water works, as they have an excellent quality of water. When you consider the vast quantity of well watered land that can be had for a nominal price, and think of the immense Western irrigation schemes to bring land under cultivation and the cost of such projects, it is surprising that the course of empire is not more southerly. Ocean voyagers usually go in raptures at the beautiful bay of New York, and think how charming it looks as they sail up the bay. I thought so, too, when I saw the ice floating around, the hills crowned with snow and the nice snug looking houses all fixed up with good heating appliances, and in fancy I could see the people sitting around the good old stove; yes, I could imagine the family cat and the family dog dozing around and enjoying its comforts; it made one feel very jolly, and to think of giving up these good things for a winter in Florida! In the language of the minstrel, "How foolish!"

The Rockford Grate.

The Rockford Grate Company of Rockford, Ill., are offering the trade an interesting assortment of grates of rich and artistic design, all of which we understand are copyrighted. This grate has interchangeable parts, so that either a shaking or dumping grate and any frame or summer front desired can be used. The back is cast in one piece, but the top and dampers are removable. This, it is claimed, prevents cracking from intense heat, while the parts can be readily replaced if for any reason such a course should become necessary By means of double flue chambers all difficulty with the draft is claimed to be avoided, and as the coal front is double all ashes and cinders fall through the space between them to the pit behind the ash screen. This is a feature which cannot fail to be appreciated by careful housekeepers, especially if they have had experience with grates from which the ashes were scattered over the hearth. The grate is regulated much the same as a stove, and as the designs are rich and artistic they form a pleasing addition to the appearance of the rooms in which they may be placed. In Fig. 1 of the accompanying illustrations we show what is known as the

The Rockford Grate.—Fig. 1.—Front View of Grate No. 203.

Fig. 2.—View Showing Construction of Shaking Grate, Brick Sides and Back, and the Double Draft Dampers Closed.

company's No. 203, measuring 30½ inches wide and 30¼ inches high. The frame is made in one piece and the back and sides are of fire brick. It has a double damper in front, a double basket front and an adjustable summer front. In Fig. 2 we present a view with the front removed, showing the construction of the shaking grate, the brick sides and back and also the double draft dampers closed. We understand the Rockford grate is offered to the trade as a decided improvement upon the old style, and one that overcomes many of the objections often urged against open grates. All the parts are fitted and put together at the factory. and each grate is boxed ready to put in position.

ODD PLATES.

A VARIETY of elegant mantels and fire places are on exhibition at the showrooms of W. Jackson's Sons, 246 Front street, New York. Mantels are exhibited that have been specially designed for use in halls, libraries, parlors and chambers and adapted to all styles of architecture. They are made of oak, ash, maple, curly birch and some finished in white and gold. Some are shown with beveled French plate glass mirrors, and others, very handsome, are built of tile, red earthenware and terra vitrea, plain and with deep recesses above the fire place bordered with artistic wrought iron or castings of iron and brass of appropriate design. The mantels serve to show seemingly unlimited styles of fire places and grates for coal, wood and gas, some fitted with andirons and others with logs and baskets. Some of the fire places are lined castings bearing ornamental designs of conventional, artistic or special character. Others are built entirely of tile, affording an opportunity for a grace of contour and a considerable license in coloring. Onyx, Sienna and Rose Numidian marble and glass mosaics are used as borders for the fire places with splendid effect, and having ornamental bands of brass and iron. The fire baskets and portable grates are adapted in style and ornamentation to their surrounding; some lusterless, others bronzed and plated or of cast brass or wrought iron. The andirons are in themselves a fine show, wrought iron being worked into fantastic shapes and into dragons or in rugged simplicity; brass is used cast, spun and stamped, highly polished or in antique finish in different colors and sometimes gold and silver plated. The shafts are made round and square, straight and taper, plain and fluted, and of onyx and marble surmounted by wreathes, urns and various ornaments. The fenders are of equal beauty and unlimited variety. The fuel holders, hods and fire sets seem too handsome for use. The summer pieces for fire places are art castings, "A Japanese Minstrel" and "Sans Souci" being notable. The gas grates and logs make a fire place an unalloyed pleasure and are in keeping with the other lines, which make a visit to the showroom something to be undertaken by every one who is able to do so.

THE FERROSTEEL COMPANY, with office and warerooms in Cleveland and with foundry at Chagrin Falls, Ohio, have issued a rather unique pamphlet entitled "Blue Book for the Register Trade." It consists of a number of pages of varying shades of blue printed in blue ink and bound in deep blue covers with embossed side title in old gold. The matter consists of illustrations and price-lists of Ferrosteel warm air registers and ventilators, numerous designs being shown covering Moorish, Byzantine and Composite Lattice patterns. All styles of registers can be supplied finished in white or black japan, electro plated in nickel, copper, bronze, silver, brass and solid brass or bronze metal. The company carry a large and well assorted stock at their warerooms, 17 and 19 Long street, Cleveland. They request that all correspondence be addressed to them at 106–108 Superior street. Cleveland, Ohio, where are located their main offices.

THE BELLAIRE STOVE COMPANY of Bellaire, Ohio, are now running their works four days a week instead of three as previously.

T. B. HUSSEY & SONS of North Berwick, Maine, are very busy getting out goods to meet the spring demand. Owing to the fire which destroyed a portion of their plant, manufacturing operations were checked to some extent, but the work of erecting the new buildings is being rapidly pushed forward and it is expected that everything will be running smoothly in a short time.

THE LEXINGTON STOVE FOUNDRY, at Lexington, Ky., resumed operations on Thursday, March 7, under the management of assignee O. W. Snyder.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., favor us with circulars illustrating their line of wrought steel ranges and also their Silver Peninsular and Bronze Peninsular ranges, the last two being entirely new constructions and brought out to meet the popular demand for satisfactory goods at low prices. They are made for burning wood and are offered the trade in a number of sizes and styles. Each stove has six boiler holes and the ornamentation is of an attractive character. The company have recently established an agency for their furnaces in the western part of the city under the management of Samuel J. Genilloz & Co., 1330 Grand River avenue, Detroit, Mich.

THE PLANT of the Cortland-Howe Ventilating Stove Company, at Cortland, N. Y., has resumed operations, after the usual shut down for repairs and inventory.

THERE is said to be some prospect that the foundry of Burdett, Smith & Co., at Troy, N. Y., will resume operations this spring. It has been idle all winter, but trade has been improving in different parts of the country, and it is now thought that the stove foundry will soon be started again.

THE STANDARD RANGE & STOVE COMPANY were formed a short time since at Terre Haute, Ind., with a capital stock of $50,000. The meeting was held in the store of the Townley Stove Company, at which time officers and directors of the new concern were elected. The purpose of the new organization is the manufacture of stoves and ranges on a large scale. What is known as the old King plant will be utilized for a time, but subsequently the works will be enlarged, as the company own several feet of ground not yet built upon. It is also stated that if the demands of business should warrant it, a new site will be selected and a large foundry erected. The Board of Directors consists of H. P. Townley, E. J. King, M. J. Hynes, B. G. Hudnut, William Donoghue, George S. Zimmerman and S. L. Fenner. The directors then held a meeting and elected H. P. Townley president; E. J. King, vice president; M. J. Hynes, secretary, and W. E. Donoghue, treasurer.

THE CRAIG REYNOLDS FOUNDRY COMPANY of Dayton, Ohio, and with Western branch at 82 Lake street, Chicago, Ill., have just issued an interesting publication, entitled "The Triumph Estimate Book." It is issued for the use of the trade and in the hope that it will prove of service in keeping a more systematic record of estimates on furnace work and data connected therewith. Among the opening pages we find some remarks relative to estimates and adjustments, sample blank of proposal and specification for furnace work, together with tables showing the sizes, weight, dimensions, capacities, &c., of the various kinds of Triumph heaters made by the company. Some of the pages of the book are ruled in such a way as to cover the various items necessary, while other pages are left blank for memoranda. The volume is arranged with a great deal of care and seems to meet a pressing need of the trade.

THE SPEICH STOVE REPAIR COMPANY, who were recently formed at Milwaukee, Wis., with a capital stock of $50,000, have the following officers: President, Albert Speich; secretary and treasurer, Jesse C. Bradley. The new concern succeed to the business formerly conducted by Albert Speich and Speich & Bradley, both of whom dealt in stove repairs and stoves. The new concern will occupy a five story double store at 130–132 West Water street, and we understand it is their intention to largely increase their facilities so as to make the company one of the largest in the country in their particular line.

THE JOLIET STOVE WORKS of Joliet, Ill, are calling the attention of the trade to Moore's air tight heater and Moore's Extra cook stove by means of prettily decorated blotting pads. These are printed in colors and carry, in addition to advertising matter relative to the goods named, a calendar for the month of March.

THE ROCKFORD GRATE COMPANY of Rockford, Ill., began business a short time since, manufacturing artistic fire place furnishings. They first turned their attention to coal grates and have already brought out quite a large line of fine grates in which many improvements have been made on the ordinary club house grate. They have just issued a neat catalogue of 16 pages illustrating the several styles thus far brought out. The company are now at work on a line of gas grates.

CHARLES NOBLE & CO., Philadelphia, are putting on the market several new ranges of handsome design and replete with modern conveniences. The Home Liberty is an elevated boiler range especially adapted to the requirements of builders. It is supplied in portable and brick set patterns with right or left hand ovens and fire boxes, with or without pipe shelf, upper and lower warming closets and attachment for heating upper rooms. The Prize Liberty is similar in most respects to the Home Liberty, but is particularly for use with a vertical boiler. The Best Liberty is another range of the same order, but designed for a brick setting. All these ranges are supplied with either five or six holes, open or closed ends, and, when required, with skirt base and feet. The firm are improving their well-known Iron King range by the introduction of a bracket reservoir, and the old style reservoir attachment is being ornamented to harmonize with the oven door.

BEARING the ever defiant rooster on its red cover, a 32 page catalogue reaches us from Sam S. Utter, 113 Beekman street, New York. It is printed in blue and the introductory is characteristic. The first 18 pages are devoted to the Game and Summer Girl lamp stoves, followed by a page on the musical line, Solo, Duet, Trio and Quartette lamp stove. Then comes the New Game cast iron cooking stove with two, three and four hole tops, heating drums and ovens, with the Bantam Game and the Parlor Game oil heaters. Several pages are devoted to the Game gas hot plates and sad iron heaters. The last pages show Sam S. Utter's patent wick tube, which is msde in one piece without a seam, and give directions for using oil stoves to get the best results.

REEVES & SMILEY, 129 North Second street, Philadelphia, have been appointed sole selling agents for the stoves and ranges made by the Plymouth Foundry Company for the States of Pennsylvania, New Jersey, Delaware and Maryland.

A FRENCH CONSULAR REPORT from the Cape of Good Hope states that gas stoves are being largely adopted in that colony in every place where gas is available. There are about 800 now in use in Cape Town.

"A FEW Natural Gas Burner Facts Worth Considering" is the title of a little pamphlet from the Hollands Mfg. Company, Erie, Pa., giving cuts and descriptions of 74 different sizes and designs of gas burners for use in cooking and heating stoves and hot air furnaces.

THE EXCELSIOR MFG. COMPANY of St. Louis, Mo., have just brought out the New Charter Oak four-hole cook stove, of attractive ornamentation and substantial construction. It is provided with wire gauze door, but the arrangement is such that it can be changed from gauze to solid door by simply closing the gauze by means of a fan shaped register or sliding plate. This scheme of construction permits the air to be admitted into or excluded from the oven at pleasure.

A. L. CANFIELD, at Pearl and Beekman streets, the New York manager of the Danville Stove & Mfg. Company, Danville, Pa., is making a display of seasonable goods in the line of Monarch gas and gasoline stoves. The Royal Monarch gasoline stove is of the cabinet style with a drop oven door and a special adaptation of the new process burner. Their No. 14 Monarch is a family stove of the single generator type, and has a special feature in a subflame under the generator burner. After the stove is once lighted the sub flame can be put out, to be lit again when the regular burners are shut off. The subflame then consumes a small quantity of fuel, keeping the generator warm ready for lighting the burners at any time. The Royal Monarch gas stove presents a handsome appearance in a black japan body, which is brightened with heavy bands that are polished and nickel plated. The burner of this stove presents some new features similsr to those, it is said, used in the construction of the central draft lamps. Another feature of the burner is the construction of the needle valve governing the supply of gas. The tapering needle point does not taper all the way to the full size of the valve rod, but tapers more sharply and ends in a shoulder. This shoulder fits up against a seat and prevents the opening around the needle point from becoming enlarged by frequent use.

RATHBONE, SARD & Co. have been running their stove works at Aurora, Ill., on full time, with a full force of hands, since March 1. Prior to that date they ran on part time with a reduced force. This resumption of activity shows considerable faith in the future.

B. W. DODSON, who was for years a prominent and very popular member of the stove trade, is now secretary and treasurer of the Geneva Washed Gravel Company, Ogden Buildlng, 38 Clark street, Chicago.

THE DETROIT VAPOR STOVE COMPANY have been incorporated at Detroit, Mich., with a capital stock of $150,000. Incorporators are John S. Sherman, Edwin G. Mummery and George H. Harms.

THE HEALD FARQUHAR FURNACE COMPANY have incorporated at Des Moines, Iowa, with a capital stock of $10,000. Incorporators are W. J., A. W. and I. Heald.

WILLIAM H. SARD, vice-president of Rathbone, Sard & Co., has abandoned Chicago temporarily and will take a few weeks' vacation in Florida to recuperate after a severe struggle with the "grippe."

KIECHLE, BRENTANO & OBERDORFER, proprietors of the Southern Stove Works, at Evansville, Ind., have adjusted the labor troubles in their works and everything is again running smoothly. According to an interview with August Brentano of that firm, published in a local paper, the difficulty originated in January when the molders refused to work on a Franklin stove which they claimed was a "strike" job. All but 11 stood firm when the issue was finally presented to them to go to work on this stove or leave the premises. Non-union men were then employed, and the 11 old hands were so harsssed by the strikers that they were obliged to quit. The works then ran wholly non-union. On the 4th inst. G. F. Valentine of San Francisco, vice-president of the International Molders' Union of North America, called on Mr. Brentano, and after a thorough discussion of the situation a method was found through which the differences were adjusted. Mr. Brentano says in conclusion: "The matter is now settled to the firm's satisfaction in every detail. The firm are in far better condition in regard to their rights and privilege in our works than we were before the strike occurred. We now know what we sre doing. Heretofore our employees ran our business, and hereafter we will run it ourselves and to suit our own fancy and in accordance with the new management. You might add that we will have nothing to do whatever with the local union. Our contrsct is made solely and directly with the International Molders' Union of North America. The union men have paid all the non-union men's transportion out of the city, or taken them into the union. The union force will work for us commencing Monday morning. I engaged 50 molders to-day, including the 11 who stood by me in time of need. There is no reason why these men should not continue their work, as Mr. Valentine admitted to me that the men, our employees, alone were in the wrong."

THE FERGUS FALLS SHEET METAL WORKS have been started at Fergus Falls, Minn., by Charles Featherstone, who will manufacture the Surprise heater.

THE FULLER-WARREN STOVE COMPANY of Milwaukee held their annual meeting on the 6th inst. and elected the following Board of Directors: Walter P. Warren and G. G. Wolf, Troy; H. A. Viets, John E. Hausen, Wm. Plsnkinton, Francis Hinton, H. S. Haselton, Geo. L. Graves and John Johnston, Milwaukee. A satisfactory year's business was reported, taking general trade conditions into consideration.

THE NEW BUILDING which will soon be erected by the Cleveland Steel Range Company of Cleveland, Ohio, will be 50 x 192 feet and three stories in hight. The main entrance will be at the corner of Detroit and State streets and constructed in the shape of an alcove. The offices will be located on the first floor of the Detroit street front, while the storerooms, laboratory, shipping and erecting rooms, together with the engine and boiler room, will occupy the remaining portion of the floor. The second and third floors will be used for manufacturing purposes. The rear of the proposed building will front on Vermont street and there will be a double door entrance on Vermont and State streets. The estimated cost of the new building is placed at from $15,000 to $20,000.

"THE FRIEND OF THE FAMILY" is the title of a little pamphlet which comes to hand from Buck's Stove & Range Company of St. Louis, Mo. The opening pages consist of a talk on stoves, covering their selection, use, attachments, &c. The pages then describe how to make candy of various kinds, the recipes being presented very full and complete. The illustrations and compilation are by Bert Ball.

THE PORTLAND STOVE FOUNDRY COMPANY of Portland, Maine, have just issued a very neat four page folder printed in colors and calling attention to their Atlantic hot water and warm air combination heater, which is offered the trade in numerous sizes. The device is shown in sectional view, clearly indicating the internal arrangement of parts, while the descriptive text calls attention to the leading features of merit. Illustrations of several dwellings heated by the company's system are also presented.

FRED. E. LEE, manager of the estate of P. D. Beckwith, Dowagiac, Mich., writes us under date of March 5 that after a two weeks' shut down the Round Oak Stove Works resumed operations on Monday, February 25. The works have been running nesrly full since that date, and it was expected by the end of the first week in March they would be turning out their usual amount of work.

THE UNION STOVE WORKS, 70 Beekman street, New York, have completed arrangements by which they are the Eastern agents of the Milwaukee Gas Stove Company, Milwaukee, Wis. They are already making a display of cooking and heating stoves. The Perfection gas ranges on their sample floor are connected with the gas supply and shown in full operation.

W. H. WHITEHEAD, president of the Chicago & Erie Stove Company of Erie, Pa., favored Chicago with a week's visit recently. Mr. Whitehead passed so many years in Chicago and enjoys such a wide circle of acquaintances who hold him in high esteem that a visit there is a perpetual round of handshaking.

TRADE REPORT.

The Iron Market.

Expecting that it would furnish the impetus for a rising tendency, manufacturers of Iron would gladly see a moderate advance in Ore and Coke. But no one wants to be the pioneer and run the risk that competitors cover later at lower prices. While the attitude of buyers of Raw Material is friendly, it is also one of uncertainty and suspicion.

Southern producers of Pig Iron have booked orders quite heavily and yet the market remains stationary with occasional soft spots. In Cincinnati two contracts, one for 12,000 tons of Pig Iron and another for 18,000 tons, were placed by Pipe founders to cover sales of product.

Pig Iron statistics for the month of February show that production is not up to the mark reached earlier in the year. This is chiefly due to the fact that a number of furnaces are undergoing repairs and confirms the statement made some time since that the really modern plant north of the Potomac and the Ohio capable of making Iron at present prices is fully engaged.

Pig Iron.—The movement in the New York district has been light during the past week. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

The demand for Pig Iron in the Philadelphia district has been a little above the average of the past few weeks, but the supply has been in proportion, so that prices are unchanged. Makers of Pig Iron do not regard the situation with much cheerfulness, as it is found impossible to get more money for their Iron, and there is besides a very general complaint in regard to the slowness with which payments are made. Sales include all grades of Iron; the heaviest lots have been No. 2 Foundry at $11 @ $11.25 for Philadelphia and equivalent points, and at about $10 for No 2 at such points as York, Columbia, Harrisburg, &c. Schuylkill Valley buyers have also taken fair sized lots. Ordinary quotations are about as follows for Philadelphia rail deliveries, and from 30¢ to 50¢ less for water, or at points such as York, Harrisburg, &c.:

Standard No. 1 Foundry X	$12.00 to $12.50
Standard No. 2 Foundry X	11.00 to 11.50
No. 2 Plain	10.75 to 11.00
No. 1 Soft	11.50 to 11.75
No. 2 Soft	10.75 to 11.00

The Chicago Pig Iron market is reported as in excellent shape, every week showing a good movement in both Northern and Southern Iron. Contracts for the former are rather larger than for the latter, which, of course, is to be expected. The foundrymen who are buying the most material are the makers of specialties. Jobbing foundries are quiet. More Lake Superior Charcoal was sold during the week than for a long time. Some consumers are now disposed to make season contracts, but they are calling only for small monthly shipments. Large consumers are still holding off. Quotations are as follows for cash:

Lake Superior Charcoal	$13.00 to $13.50
Local Coke Foundry, No. 1	10.25 to 10.50
Local Coke Foundry, No. 2	9.75 to 10.00
Local Coke Foundry, No. 3	9.50 to 9.75
Local Scotch No. 1	10.25 to 10.50
Ohio Strong Softeners, No. 1	12.50 to 13.00
Southern Silvery, No. 1	11.50 to 11.75
Southern Silvery, No. 2	11.25 to 11.50
Southern Coke, No. 2	10.00 to 10.25
Southern Coke, No. 3	9.50 to 9.75
Southern, No. 1, Soft	10.00 to 10.25
Southern, No. 2, Soft	9.50 to 9.75
Alabama Car Wheel	17.50 to 18.00
Jackson County Silvery	15.00 to 15.25
Other Ohio Silvery	14.25 to 14.50

The demand for Bessemer Pig Iron has been extremely light in the Pittsburgh market during the week, and prices are showing a somewhat weaker tendency. On account of the unsettled condition of the Coke question, furnaces are not pressing the market for sales. Mill and Foundry Iron are quiet in demand and unchanged in prices. We quote as follows:

No. 1 Foundry	$10.50 to $10.65, cash.
No. 2 Foundry	9.65 to 9.70 "

The feature of the week in the Cincinnati Pig Iron market has been the large buying of Southern metal by Pipe works, both in the East and West, the principal orders having been secured by local agents. Several days since a contract for about 12,000 tons was placed by local manufacturers of Cast Iron Pipe, and on Monday another order for 18,000 tons was secured by representatives of Cincinnati houses. Both contracts have been entered by Southern furnaces at prices represented by inside quotations, and the deliveries extend over the next five months. The bulk of the sales has been of No. 3 Foundry and No. 2 Soft at $6 25 and $6.50 ℔ ton respectively. Birmingham basis, or $8.50 @ $8.75 ℔ ton; Cincinnati basis, No. 2 Foundry and No. 1 Soft at $6.75 Birmingham, or $9 Cincinnati. For some time past the demand for Softeners has been relatively greater than for the ordinary foundry grades, especially for No. 2 Soft, so that in a schedule of prices No. 2 Soft appears as an intermediate grade—that is, between No. 3 and No. 2 Foundry in price, but No. 2 Foundry and No. 1 Soft are regarded as upon the same level of value. The demand for No. 1 Foundry is relatively light, and it is quotable at $7.25 Birmingham or $9.50 Cincinnati. The contracts placed by radiator manufacturers cover about 9000 tons. In addition to the large trade noted there has been a fair inquiry from and moderate sales to the general consumer. Car works have made additional purchases of 500-ton lots, and general foundries and mills have shown more disposition to buy more freely, or rather less sparingly. Taken all in all, the trade conditions are more encouraging and manufacturing lines are especially confident. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.00 to 9.25
Southern Coke, No. 3	8.50 to 8.75
Ohio Soft Stone Coal, No. 1	14.50 to 15.00
Ohio Soft Stone Coal, No. 2	14.00 to 14.50
Lake Superior Coke, No. 1	11.75 to 12.25
Lake Superior Coke, No. 2	10.75 to 11.50
Hanging Rock Charcoal, No. 1	16.00 to 16.50
Hanging Rock Charcoal, No. 2	15.50 to 16.00
Tennessee Charcoal, No. 1	13.00 to 13.50
Tennessee Charcoal, No. 2	12.00 to 12.50

Sales in the St. Louis market are reported as showing a slight improvement, but they still continue to run largely to quantities which will not average much over 200 and 300 ton lots. The local Pipe works are running full and are steady consumers of Pig Iron, and a noticeable increase is reported from the Stove foundries as well as a good trade from the machine shops. The demand runs largely to No. 2 Foundry and No. 1 Soft, which are quoted respectively at $6.50 and $6.75, f.o.b. cars Birmingham. Consumers are not disposed to anticipate their wants more than 60 days ahead and large sales are necessarily limited. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.00 to $10.25
Southern Coke, No. 2 Foundry	9.50 to 9.75
Southern Coke, No. 3 Foundry	9.00 to 9.25
Southern Car Wheel	16.00 to 16.50

Metal Market.

Pig Tin.—The movement in wholesale prices has been narrow, not exceeding 0.25¢ @ 0.30¢. Speculation has shown less animation and nothing distinctly new in the way of incentive to operations has materialized. At intervals there were signs of weakness and of strength, but neither developed pronounced form from which "bulls" or "bears" derived any decided advantage. Business with out of town dealers and with consumers was slack during the early part of the week, but subsequently improved and involved quite the average amount of Tin all told. Prices at the close were firm on cable advices of an advance in London. Small lots of Straits Pig from store are quoted at 15¢ @ 15¼¢. Arrivals during the week were moderate, but the supply afloat is considerable and the general statistical position is without important change.

Copper.—Prices during the week have fallen to a still lower level. On the decline a very fair business has been done, chiefly in the form of moderate sales to home consumers. In some quarters it is asserted that the decline was due to manipulation by alleged "shorts," but this has hardly the foundation that is back of another explanation to the effect that the market suffers from heavy supplies at producing points, conservative buying by home consumers and difficulty in working export business except at lower prices than those above quoted. In point of fact the market has the appearance of being weak on its merits. Jobbers are quoting 10½¢ ℔ lb for Lake Ingot in small quantities and about 9¾¢ for Common Casting brands.

Sheet Copper.—Consumers are showing more inclination toward purchasing for stock. Inquiry is fairly brisk and some increase is noted in orders for Cornice Copper. Small lots of Sheet Copper from store are quoted at the list price, 14¢ ℔ lb, net.

Pig Lead.—Dealings have been on a very moderate scale and no improve-

ment whatever in the demand has taken place. Buyers go hardly as far as to make reasonable bids on round lots. Prices are a trifle lower and the market is weaker in tone Retail quantities of American Pig from store are quoted at 3⅞¢ @ 3½¢ ℔ lb.

Lead Pipe and Sheet.—A better feeling is reported among buyers, although the strikes in the building trades in this city have caused a temporary lull in the demand for material for spot use. The outlook in the department of Plumbers' Supplies is regarded as favorable for a good summer and spring business. Prices in this section are maintained on the list basis, namely, 5½¢ for Pipe and 6½¢ for Sheet, with 20 per cent. discount.

Spelter.—Buying interest has not been as good as it was during the preceding week, and the demand at present is lifeless, being mainly confined to small lots for early delivery. Western brands in small lots are quoted at 3¾¢ @ 4¢ ℔ lb from store.

Antimony.—A moderate business only has been effected. For small quantities the ruling quotations are about 8¢ for Hallett's and 9¼¢ for Cookson's.

Tin Plate.—Little or nothing in the way of improvement is perceptible in the condition of the market for foreign Plates. Orders from the canning trade are still much below the average for this season in the matter both of spot and forward deliveries. Other consumers, too, show as yet only a moderate inclination toward purchasing beyond the limits of their immediate needs, and dealings in spot stock, although somewhat larger in the aggregate than last week, do not rise above the commonplace. The slackness of business has induced an added keenness in competition for orders, which, together with the augmented output of the domestic works and unfavorable advices from abroad, has served to keep prices unsettled and weak. Stocks in the New York warehouses are not excessive, and the assortment is far from full.

A special London cable dispatch of March 13 to *The Iron Age* reports as follows on the British Tin Plate market: Tin Plate prices average three halfpence lower and the market is very depressed. Many makers are unable to accept such low limits. Buyers seem to be awaiting developments. The proposed scheme to control prices receiving little support has had adverse effect upon the market. Larger demand reported for Wasters for Eastern markets. Stocks at Swansea now about 239,000 boxes, a decrease of about 48,000 boxes the past week. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20	8/10½	@ 9/3
Siemens Cokes, IC 14 x 20	9/3	@ 9/6
Ternes, 20 x 28	17/6	@ 22/6
Charcoals, IC 14 x 20	10/	@ 13/

THE NEW PLANT of the Pittsburgh Reduction Company, manufacturers of pure aluminum, at Niagara Falls, N. Y., which has been under construction for some months, is about completed and is expected to be put in operation about April 1 next. At the start out the plant will have about three times the capacity for the manufacture of pure aluminum over the present plant of this concern located at New Kensington, Pa. This concern have been negotiating for some time with the United States Government for the supplying of aluminum for three new torpedo boats and they expect to secure the order.

Chicago Report.

Scrap.—A moderate trade is in progress, which is sufficient to take about all the Old Material now offering. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$6.50	....
Machinery Cast	5.50	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	7.50	....
Copper Bottoms	....	6 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	6 ¢
Light Brass	....	3 ¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2¼¢
Rubber	....	4 ¢

Anthracite.—Business is light. Carload lots of 12 net tons or over are quoted as follows, although some concessions are now being made:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$4.75	$5.00
Milwaukee, Wis	4.75	5.00
Kansas City, Mo	7.95	8.20
Council Bluffs, Iowa	7.95	8.20
Lincoln, Neb	8.10	8.35
Sioux City, Iowa	7.95	8.20
Aberdeen, S. Dak	8.00	8.25
Dubuque, Iowa	6.05	6.30
Madison, Wis	6.25	6.50
St. Paul, Minn	7.25	7.50
Burlington, Iowa	6.25	6.50
Des Moines, Iowa	7.75	7.95
Davenport, Iowa	6.05	6.30
St. Joseph, Mo	7.95	8.20
Leavenworth, Kan	7.95	8.20
Omaha, Neb	7.95	8.20

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

AN ENTIRE FLOOR of the William Yerdon Factory, at Fort Plain, N. Y., is being equipped with the latest machinery for the manufacture of tin pails, which is a new industry for the place. A pail is manufactured, it is stated, in two minutes after passing through various machines. Mr. Yerdon has secured the services of Thomas McAnamy of Los Angeles, Cal., who for a number of years was superintendent of one of the largest factories of this kind on the Pacific Coast. The superintendent of the pattern making department is E. E. Beckwith of Newark, N. J., who was for several years with the A. C. Beckwith pattern making works in that city. A large force of men will be put on as soon as the factory is ready for operation.

CHARLES HOOPER & Co., Dubuque, Iowa, issue circulars calling attention to their muffle Furnaces, also their smelting Furnaces and annealing and burning Furnaces. The muffles are particularly intended for enameling work. At the end of the circular are a number of testimonial letters from those who have used these Furnaces with satisfactory results.

CONDITION OF THE

Hardware Trade.

IT IS PLEASANT to note the improvement in business which is perceptible in some of the trade centers, as this encourages the hope that with the further advance of the season there will be such a general increase in the volume of business as will bring the demand up to something like its normal volume. The indications seem to point to a more marked improvement in the South and West than in the Middle and Eastern States. While it is the general experience that the volume of business is better this year than last, it is not uncommon to hear references to the sluggishness of trade and the reluctance of merchants to buy at all freely. Stocks are certainly kept at an abnormally low point, prices show little change and the market does not as yet assume a regular and uniform tone. There is some complaint in regard to collections and credits are being scrutinized with more than the usual care.

Advices from Chicago.—Shelf Hardware exhibits decided improvement. Orders are still confined to small lots and packages are broken as much as ever, but the orders are very much more numerous. Stocks continue extremely light throughout the country, and as spring advances the demand grows heavier on the retail merchants and they are obliged to replenish more frequently. The weather has been wintry for the past week and has undoubtedly checked outdoor operations considerably, and it is therefore argued with much reason that if trade can be so good under these conditions, it must make a decided spurt as soon as actual spring weather sets in and all kinds of outdoor improvements can be undertaken. The demand for Poultry Netting has been extremely heavy for the past week, but other seasonable goods have not been moving in very large quantities. Prices show little change. Carriage Bolts are still irregular owing to conflicting quotations from manufacturers, and Screws are unsettled on account of the recent circular issued by a large company. The movement in Tinware and House Furnishing Goods has shown a notable increase during the past few days, and the dullness of February is now in a fair way to be forgotten. Taking a broad view of the Hardware situation, it is believed that the volume of business so far this year has been a distinct gain on that of last year up to the same time. Inquiries for Roofing Plates have been larger recently than at any time since last fall, and an early improvement is confidently expected.

Notes on Prices.

Wire Nails.—The volume of business is fair but not especially heavy, the trade confining their purchases to quantities sufficient to cover their early requirements. The tone of the market is not materially different from last week, but there are indications that one or two of the mills are making slight concessions in prices. The fact that jobbers are cutting the price has some effect even beyond the territory in which such cut prices are offered. With the opening of the spring and the going into effect of the new freight rates it is expected that there will be a quickening in the demand, and some are looking for a marked

strengthening in the market with a possible advance.

Advices from Chicago.—Manufacturers appear to be well satisfied with the existing situation, except only with reference to trade in this city. They state that prices are firm and a good volume of business is moving. Predictions are quite freely made of an advance in manufacturers' prices before April 1, on account of the anticipated increase in the demand as soon as actual spring weather is experienced. Jobbers have recently enjoyed a considerably better business from retail merchants, but they state that their trade in this line is very much below the volume enjoyed last year up to the corresponding time. Small lots from stock are quoted at $1 to $1.05, but carload lots are still sold by a few of the leading houses at the old low price, equivalent to 95 cents, Chicago.

Cut Nails.—Somewhat more business is doing in Cut Nails than a week ago. The market continues without change. Small lots from store, New York, are held at 85 to 90 cents.

Advices from Chicago.—Manufacturers have enjoyed a somewhat better business since our last report. Orders seldom run above carload lots, but these have been a little more plentiful. Jobbers sell small lots from stocks at $1.

Barb Wire.—An increasing activity is evident, and the demand is setting in somewhat more freely. The prices at which Barb Wire is being offered by some of the jobbing houses have the effect apparently of unsettling the market to a slight extent. The outlook for the season's business is regarded as favorable.

Advices from Chicago.—Orders are increasing for shipment from factory. The movement recently has augmented very considerably. The expected increase in March is now being realized, and almost every day shows a greater demand. Some of the factories are now very busy, and managers will not be surprised if in a short time they fall behind their orders in accordance with their rules of experience. Small lots from stock are in improving demand at $1.65 for Painted and $2 for Galvanized.

Screws.—There has been no important change in the Screw market since our last issue. The volume of business appears to be moderate, the lower prices announced not having the effect to any marked degree of stimulating trade. Several of the manufacturers have refrained from issuing circulars announcing the revised prices, which are referred to as unprofitably low. The object of the manufacturers in adopting the new discounts was to make them represent the market, and they are adhering quite firmly to them and refuse to give extras as before.

Binder Twine.—The Binder Twine market is in a demoralized condition as far as prices are concerned. While prices are nominally based upon a quotation of 5 cents per pound for Sisal Binder Twine, it is reported that the held over or Banker's Sisal Twine has been offered at 4 cents per pound. While this price is not being met by manufacturers of new Twine, it is a leverage which shrewd buyers make use of when requesting quotations. It is understood, however, that some manufacturers are not desirous of selling Sisal Twine for less than 5 cents, although this price applies to both small and large quantities. Orders have been placed more freely for Twine during the past two weeks than heretofore this season, although the volume of business is still small. The following quotations for Twine represent the market fairly well:

	Per pound. Cents.
Sisal	4¾ to 5
Standard	5
Manila	4¾ to 6
Pure Manila	6¾ to 7

Comet Lawn Sprinkler.—The Comet Lawn Sprinkler, put on the market by the E. Stebbins Mfg. Company, Brightwood, Mass., and illustrated in our issue of the 23d ult., is sold to the trade at $5, subject to a discount of 20 per cent.

Numyr Nozzles.—H. F. Neumeyer, Macungie, Pa., manufacturer of the Numyr Nozzles, a description of which was given in our columns a few weeks since, advises us that in view of the number of Nozzles sold and ordered, he has reduced the price from $54 per gross to $50 per gross.

Glass. — There are no encouraging features in the Glass market, demand continuing limited and prices unremunerative. Committees were appointed at the manufacturers' meeting held in Pittsburgh February 28 to investigate certain features of the Glass business and to report at the next meeting. The subject of foreign competition is receiving considerable attention in connection with the attempt of manufacturers of American Window Glass to work in harmony. It is understood that foreign producers secure advantages in freight to inland points by obtaining direct rates from Liverpool to Chicago and Minneapolis, thus laying their Glass down at those points at a less cost than Pittsburgh manufacturers are able to do. This matter, among others, is receiving the attention of the American manufacturers. It is impossible to determine the result of the movement among manufacturers, as the Glass interests are so large and diversified and as so many questions will have to be considered before any agreement can be reached.

Roofing Slate.—At a meeting held by the Bangor Roofing Slate Manufacturers' Association, at Easton, Pa., on February 28, a revised list of prices for Bangor Roofing Slate was adopted, to come into operation on April 1, 1895. The new list is as follows, per square:

Genuine No. 1 Bangor.

Size.	Price.	Size.	Price.
24 x 14	$3.35	16 x 12	$3.65
24 x 12	3.35	14 x 10	3.65
22 x 12	3.60	18 x 9	4.25
22 x 11	3.60	16 x 8	4.25
20 x 12	3.60	14 x 8	3.75
20 x 10	4.00	14 x 7	3.50
18 x 10	4.00	12 x 8	3.50
16 x 10	4.00	12 x 7	3.25
18 x 12	3.65	12 x 6	3.25

Genuine No. 1 Ribbon.

Size.	Price.	Size.	Price.
24 x 12	$2.75	14 x 10	$3.00
22 x 12	3.00	14 x 8	3.00
22 x 11	3.00	18 x 9	3.25
20 x 12	3.00	16 x 10	3.25
20 x 10	3.00	16 x 8	3.25
18 x 10	3.00		

Terms: Acceptance at 60 days from date of shipment, or 2 % for cash. All freight charges are based on 650 lb to the square. In less than carload lots the cost per square for freight is about double the cost of the carload lots.

John Galt & Son, Postal Telegraph Building, Broadway, New York, forward us the following revised price-list for Albion Vein Roofing Slate at quarry:

Size.	Price.	Size.	Price.
24 x 14	$3.25	16 x 10	$3.85
24 x 12	3.25	16 x 9	3.85
22 x 12	3.45	16 x 8	3.85
22 x 11	3.45	14 x 10	3.50
20 x 12	3.45	14 x 8	3.40
20 x 10	3.85	14 x 7	3.30
18 x 12	3.50	12 x 8	3.25
18 x 10	3.85	12 x 7	3.25
16 x 12	3.50	12 x 6	3.25

Block Tin Pipe.—A reduction has been made by the manufacturers in the list price of Block Tin Pipe from 30¢ to 25¢ ℔ lb, with the customary discount of 20%.

White Lead.—Business has been more active and the market shows somewhat improved tone. Competition is not lifeless by any means, nor have jobbers ceased to make special rates when by so doing the sale of more profitable goods is expedited; but extreme lowest rates recently made by some outside manufacturers are not duplicated and more discrimination is made by jobbers in the matter of concessions. The recognized leading brands of American Lead in Oil are quoted in retail quantities at 5¼¢ to 5½¢ ℔ lb. English is selling in small quantities only as some few brands may be wanted for some special purposes. German is finding very limited sale and importers' prices are without change.

Red Lead. — Foreign brands, the cheaper grades particularly, have been meeting with somewhat better sale, chiefly in fair sized lots for immediate delivery. The movement has served to steady prices somewhat, without, however, causing any advance over late quotations. Domestic product remains without change as to prices and is finding only routine sale. The jobbing price for moderate sized lots is about 5¼¢ ℔ lb.

Old Metals.—Business all told has been only moderate, but an improvement in the volume of inquiry indicates a better feeling among consumers of this class of material. Scrap Iron has shown a more active movement during the week, but supplies are sufficiently abundant to prevent any advance in prices, which continue low for all classes of Old Metals. The following quotations represent about the current rates paid by dealers in this city:

Heavy Copper	℔ lb 7 ¢
Light and Tinned Copper	℔ lb 6½¢
Heavy Brass	℔ lb 4¾¢
Light Brass	℔ lb 3¾¢
Lead	℔ lb 2¾¢
Tea Lead	℔ lb 2½¢
Zinc	℔ lb 2⅛¢
No. 1 Pewter	℔ lb 10 ¢
No. 2 Pewter	℔ lb 5½¢
Wrought Scrap Iron, ℔ gross ton	$7.50 @ $8.00
Heavy Cast Scrap, ℔ gross ton	7.50 @ 8.50
Stove Plate Scrap	℔ gross ton 5.00
Burnt Iron	℔ gross ton 3.00

Old Rags, Paper, &c.—Business is spasmodic, and the call for Paper stock irregular. Dealers' purchasing prices, New York delivery, are approximately as follows:

No. 1 White Rags	℔ lb 3 @ 3¼¢
No. 2 White Rags	℔ lb 2¼ @ 2½¢
Mixed Rags	℔ lb ¾ @ 1 ¢
Blues and 3ds	℔ lb 1⅛ @ 1¾¢
Hard Sized White Shavings	℔ lb 2⅛ @ 2¼¢
No. 1 White Book Shavings	℔ lb 1¾ @ 2⅛¢
No. 2 White Book Shavings	℔ lb 1 @ 1⅛¢
Light Book Shavings	℔ lb ⅝¢
No. 1 Mixed Shavings	℔ lb ⅞ @ 1 ¢
No. 2 Mixed Shavings	℔ lb ⅝ @ ¾¢
No. 1 Printed Books	℔ lb 1 @ 1¼¢
Ordinary Mixed Books	℔ lb ½ @ ¾¢
Newspapers	℔ lb 2-5¢
No. 1 Manila Paper	℔ lb ¾ @ 1 ¢
No. 2 Manila Paper	℔ lb ⅝ @ ¾¢
Bogus Paper	℔ lb ½¢
Common Paper	℔ lb ¼ @ 3 5¢
Straw Chips	℔ lb ⅜¢
Binders' Clippings	℔ lb ¼¢

Jute Butts	℔ lb	1½ @	1¾¢
No. 1 Jute Bagging	℔ lb	1 @	1¼¢
Mixed Bagging	℔ lb	¾ @	1 ¢
No. 2 Bagging	℔ lb	½ @	¾¢
Hemp Twine	℔ lb	2 @	2¼¢
Manila Rope	℔ lb	2 @	2⅛¢
Jute Rope	℔ lb	1½ @	1¾¢
Mixed Rope	℔ lb	¾ @	⅞¢

Old Rubber.—The following quotations represent about the prices paid by dealers, New York delivery:

Car Springs, ton lots, ℔ lb	$0.03¾ @ .04
Rubber Shoes, carloads, delivered at factory, ℔ lb	@ .05¼
Rubber Shoes, less than carleads, ℔ lb	@ .04¾
White Wringer Rolls, ℔ lb	@ .03⅞
White Syringes, ℔ lb	@ .03⅞

Trade Notes.

THE 1895 CATALOGUE issued by Wallace & Sons, 29 Chambers street, New York, is a well printed pamphlet of 80 odd pages. The brass and copper rolling and wire mills of the company are at Ansonia, Conn., and a general view of the works forms the frontispiece of the publication. A view is also shown of their New York warehouse, this being followed by an alphabetical index of the contents. The first goods are Sheet Brass, then come German Silver Wire, Brass and Copper Wire, Plating machines, Sheet and Bolt Copper, Cornice Copper, Copper Bottoms, Nails and Tacks. A variety of Soldering Coppers are shown, known as the Star brand, and particular mention is made that they are hand forged and not cast. Rivets and Burrs and Tubing follow, the tables of Tubing giving all particulars of both the brass and copper. Ferrules, Chains, Snaps, Brass and Zinc Stair Plates, Hinges and Checks come next; then a varied assortment of fancy Brass Borders, Oilers, Wire Cloth, perforated Brass and Copper, Lanterns, Lamps, Burners are noted. The final pages of the catalogue are given up to tables showing the difference in wire gauges; also tables of weights and dimensions of Copper and Brass Wire, weights of Sheet Copper, tables of areas, circumferences, diameter of circles and other tables of general interest.

THE GRECIAN METAL POLISH COMPANY is the name of a concern recently organized in Kingston, N. Y., for the manufacture of a liquid Polish which is said to be excellent for cleaning and polishing metals. Luke R. Ford is president of the company.

WM. J. GORDON, 218 New street, Philadelphia, is running his works at their fullest capacity. He reports that the orders on hand for his specialties are sufficient to keep his shop full for some time. He has just issued a 20-page catalogue, of convenient size, covering his line of special machinery for the manufacture of Tin and Sheet Iron Ware and Can Body Machines. Especial prominence is given to the Gordon Patent Automatic Can Body Power Seaming Machines, which it is claimed will seam and deliver at one operation, at the rate of 10,000 to 20,000 can bodies in ten hours, and are adapted for seaming the bodies of fruit, paint, lard, spice, baking powder, snuff and lye cans, and a large variety of other articles. Other machines shown are a Single Action Power Press, Combination Power Press, Double Action Power Drawing Press, latest improved Drawing Power Press and an Edge Curling Machine, all patented.

A FIRE which occurred in Detroit, Mich., on March 8, destroyed a large building occupied, along with other manufacturing firms, by the Detroit Stamping Company and Wagner & Ernewein, manufacturers of tinware. The total loss is estimated at about $90,000.

THE ALLEN & ACKLEY ANTI-RUST JAPAN MFG. COMPANY are one of the rising enterprises of Cincinnati, Ohio. The company's works are reported to be in active operation filling orders for their specialty, a preparation which is claimed to prevent the corrosion caused by the action of salt air and salt water on metals exposed to their influence. A recent government test of metal plates coated with this composition resulted in a very favorable report being made in regard to it by the navy officials who conducted the trial.

THE PLANT of the Field Force Pump Company, Lockport, N. Y., was destroyed by fire on March 8. The loss is estimated at $25,000; insurance about $12,000. About $3000 worth of new machinery had been put into the building the day before. The fire is supposed to have been of incendiary origin.

THE F. F. ADAMS WRINGER WORKS of Erie, Pa., which are a branch of the American Wringer Company, will be dismantled in the course of two or three months. The machinery will be divided between the works of the company in Auburn, N. Y., and Woonsocket, R. I. The works to be dismantled give employment to 130. The annual payroll is about $60,000. The capacity of the American Wringer Company will remain as large as hitherto by increasing the business in Auburn and Woonsocket.

THE ESTEY WIRE WORKS COMPANY have been incorporated, with a capital of $25,000. They will continue the business formerly conducted under the style of W. S. Estey at 65 Fulton street, New York. Mr. Estey, Cornelius P. McGuire, John C. Hessler and W. O. Chapman are interested in the new company.

THE lower foundry of R. D. Wood & Co., at Melville, N. J., has resumed operations.

F. I. EVERETT has been engaged by Hibbard, Spencer, Bartlett & Co. of Chicago to represent them in Northern and Central California during 1895. Mr. Everett formerly represented the Huntington Hopkins Company of San Francisco.

THE HYDRO CARBON BURNER COMPANY have been incorporated at Kansas City, Mo., with a capital stock of $100,000, for the purpose of manufacturing a vapor burning device.

JAMES E. SALTER of Philadelphia, Jawood Lukens, A. L. Murphy and Jesse L. Heywood of Conshohocken, and Lewis N. Lukens of New York, have organized the Conshohocken Galvanizing Company. The officers are: President, James E Salter; treasurer, James E Salter; secretary, Jesse L. Heywood. The company were organized for the purpose of galvanizing, leading and tinning metals. Their principal business will be galvanizing pipe. A part of the buildings of the Tube Company, Conshohocken, will be used for the present for the tanks and other necessary apparatus.

The city of Anderson, Ind., has let a contract for the erection of a garbage cremstory at a cost of about $6000.

It Is Reported—

Alabama.

That the Perry Hardware Company, BIRMINGHAM, have been incorporated, with a capital stock of $30,000.

California.

That the Barrett-Hicks Company, a corporation with a capital stock of $75,000, have succeeded to the Hardware business of Barrett, Hicks & Co., FRESNO. C. W. Barrett is president of the company, J. D. Hicks, vice-president, and George E. Evans, secretary and treasurer. These persons with F. W. Fisher and G. H. Glassford constitute the Board of Directors.

Colorado.

That W. Chapman, Hardware, GARRISON, has sold out to Chapman & Forrest.

That the Midland Hardware Company, COLORADO CITY, have sold out to John Gray.

Connecticut.

That H. L. Mills, Hardware merchant, NEW BRITAIN, has presented the Young Men's Temperance Society with a handsome and valuable umbrella rack for use in its new hall. The rack is made of oak, with metal trimmings, and is large enough to hold 70 umbrellas.

That the firm of A. H. & E. W. Abbe, dealers in Hardware, NEW BRITAIN, have just made a splendid gift to the Young Men's Temperance Society of that city. The society's new building is nearing completion and the contract with the builder says that all Hard ware used in the building shall be paid for by the society. The firm have just presented the society, through the contractor, with all the Hardware necessary to fully equip the new building.

Illinois.

That F. H. Rearick has taken his son, Harry F. Rearick, into his Hardware business at GALESBURG. The style will hereafter be F. H. Rearick & Son.

That T. W. Watt, Hardware, MORRISON, has been succeeded by Ritchie & Watt.

That Marks & Cox, Hardware, &c., ABINGDON, have sold out.

That F. A. Dutcher has disposed of his Hardware business at CHERRY VALLEY to Thomas Lee. Mr. Dutcher has had a long experience in the Hardware business and has earned the rest he now purposes to take.

That C. Kergher & Son, CARROLLTON, have sold the Stove and Hardware branch of their business to Rafferty & Carmody.

That the Hardware firm of Rowe & Jones, GORIN, have dissolved partnership, Mr. Rowe continuing the business.

That C. W. Dickerson, Hardware merchant of WYOMING, has entered into partnership with Deyo Brothers of BRADFORD, and the business in Wyoming will be conducted under the firm name of Deyo Brothers & Co. This change is made for the purpose of taking care of the increasing Implement trade, which was more than Mr. Dickerson could handle in connection with his Hardware trade.

Indiana.

That Elmer Secor of ALBION is thinking of engaging in the Hardware business at CHURUBUSCO.

That Gibbs & Thomas, Hardware merchants, GREENFIELD, have been succeeded by Thomas & Jeffries.

Iowa.

That Waples & Willits, Hardware, &c., CASTANA, have been succeeded by Waples & Sons.

That John Olinger is successor to George M. Violet in the Hardware business at AFTON.

That there is an opening for a Hardware store at MANSON CITY.

That the Hardware stock of J. H. Barlow, THORNTON, has been purchased by Elmer Bailey, who will take possession about April 1.

That MEDIAPOLIS is soon to have a new Hardware store, which will be opened in the Wesley Young Building on Main street.

That J. H. Hammond, Hardware merchant, OTO, has been succeeded by D. M. Leadingham.

That Geo. S. Sneer, formerly of WILLIAMSBURG, has started a Hardware store at WATKINS.

That W. L. Paup & Co., MANILA, dealers in Hardware and Agricultural Implements, have been succeeded by Hoffeins & Shade.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

Art of Coppersmithing.

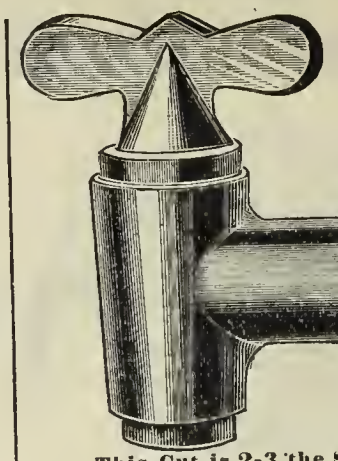
A Practical Treatise on Working Sheet Copper in all Forms.

By JOHN FULLER, Sr.

327 Pages, 474 Illustrations, 7 x 10 inches, Cloth. Price, $3.00.

This work, prepared at great labor and expense, is reproduced from *The Metal Worker*, and forms an exhaustive treatise on the Coppersmiths' Art, being the only volume on that subject that has been published. It is beautifully illustrated with 474 pen and ink drawings, and is bound and printed in the best manner.

CONTENTS:



Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea-Kettles; Oval Tea-Kettles; Beer Mullers; Funnels; Coffee Pots; Sauce pans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set fo Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

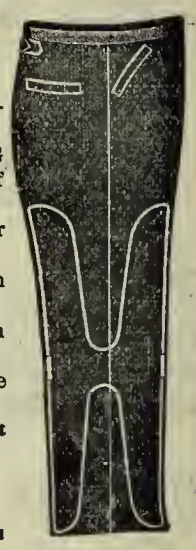
Please send for **Reduced Price List and Catalogue.**



We manufacture an Improved **GAS MACHINE** for lighting suburban and country Residences, churches, halls and factories; it is also used for cooking with perfect success. We also make Special Machines for furnishing gas for canning factories, and running Gas Engives.

Before. After.

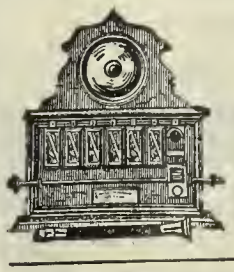
Covert Pants Stretcher.

THE Covert "Pants Stretcher" will restore the pantaloons to their original shape and length.

It removes all **WRINKLES and BAGGING AT THE KNEES,** giving them the appearance of having just left the tailor's hands.

It also holds the pants in a convenient position for brushing and cleaning.

The Stretcher cannot get out of order, and can be adjusted in the pants in a few seconds.



It being applied inside the pants, it obviates all objections prominent in other stretchers.

It is made of steel wire, and being in sections can be packed in a valise when traveling. Sold by the trade, or

Sample pair sent by mail to any address, free of postage, on receipt of $1.00.

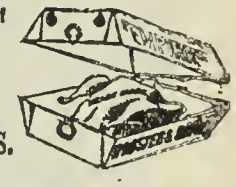
ROYAL
WASH BOILER HANDLE.

PATENTED.

We call the trade's special attention to the Royal Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.



The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

AN IMPORTANT FIXTURE.

A new Water Closet for Hospitals, School Houses and Public or Private Buildings.

THE

Puritan Wash-Down Water Closet.

PATENTED.

WHY THE PURITAN WASH-DOWN IS BETTER THAN ANY OTHER FORM OF CLOSET.

It is simple and compact. The Tank being connected directly to the closet does away with unsightly pipes on the wall and reduces the noise to a minimum and at the same time being more effective and bas a larger surface of water. The joint where the eartbenware connects with the soil pipe is under water, which is an absolute safeguard against the leaking of sewer gas. It is especially adapted for fire-proof buildings, and the soil pipe can run on the floor either in front or behind the partition. There is no chance for stoppages and there are no concealed spaces, all parts being accessible.

The body of the closet is made of vitreous or non-absorbing ware and is perfectly sanitary.

GOOD FIXTURES ARE CHEAP, AND POOR FIXTURES ARE EXPENSIVE.

Each Closet is guaranteed for a term of years. Call and see the operation of the Closet at our **SHOW ROOM.**

JOS. DIXON CRUCIBLE CO., JERSEY CITY, N. J.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

DAVID WILLIAMS,
PUBLISHER and BOOKSELLER,

A Tale of Two Spiders.

I saw not long ago an example of genuine reasoning and bitter resentment exhibited by a spider. In one corner of my yard, protected by an overhanging cornice and porch, there are several spider webs, and in particular two, one directly above the other at a distance of six inches, and each tenanted by a large spider.

I was seated in a chair in the shade on a Sunday afternoon when I noticed them, and I picked up a small chip and tossed it into the upper web to see what the spider would do. He ran out and examined the chip. An inspection of it convinced him thst it was of no earthly use to a spider, and he set about getting rid of it. He was very methodical, and went regularly around the chip, cutting the threads on each side until the chip finally hung by one strand, which he severed, and it dropped into the web of the spider who was keeping house on the lower story.

Out came the latter, thinking he had caught something, but when he found it was a chip his rage seemed unbounded. It was evidently not the first time that his upper story neighbor had dumped his refuse into the lower web, and he was determined to stand it no longer.

He went up the ropes like an athlete, leaving the chip where it fell, and in an instant was in the upper web, where he proceeded at once to attack the offender. They had a terrible fight, and rolled over and over each other, biting and hugging with ferocity. At last in their tumbles they fell through the hole where the chip had been cut out and down into the lower web, which seemed to frighten the upper spider, who was nevertheless a little the larger. After a few more tumbles he got loose and escaped up a rope to his own quarters, minus the whole of one leg and half of another. The lower spider climbed half way up in pursuit, and then stopped, it seemed, to reflect. He waited a moment, and then he, too, seemed to conclude that he had had enough, so he went back and cleared out the chip and mended his web.

I then dropped two or three straws into the upper web, but the spider paid no attention. The other had given him a lesson—had in spider language set up a sign, reading: "No dumping in this web under penalty of the law," and he was not slow to take a hint.—*Exchange.*

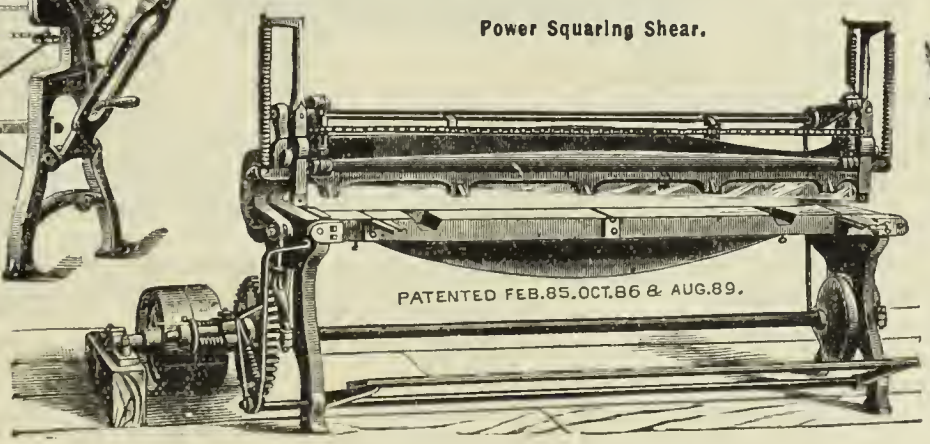
Metal Workers' Machinery.



For several years past our efforts have been directed solely towards the production of a line of sheet metal working machinery that would at once prove economical, durable and peculiarly adapted for the purpose intended. In this we have been successful beyond our most sanguine expectations and therefore desire to announce to all workers of sheet metal that it would be to their interest to correspond with us. We have a good stock of various machines on hand and in course of completion. Address

— "WHAT do you suppose ever made them call a prison Sing Sing?" "I reckon it was on account of the bars."—*Atlanta Journal.*

— "GOOD BY, Old Slow!" shouted the bicycle. "You are not in my class." "Anyway," retorted the cart horse, "I am not as awkward as you are. I don't fall down standing still."—*Cincinnati Tribune.*

— "SAY, mother, will you speak to that Sammy?"

"What's he doin' now?"

"Well, every time I hit him on de he'd wid dis hammer he hollers."—*Life.*

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Matcrials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstration is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

PRICE, POST OR EXPRESS PAID, $5.

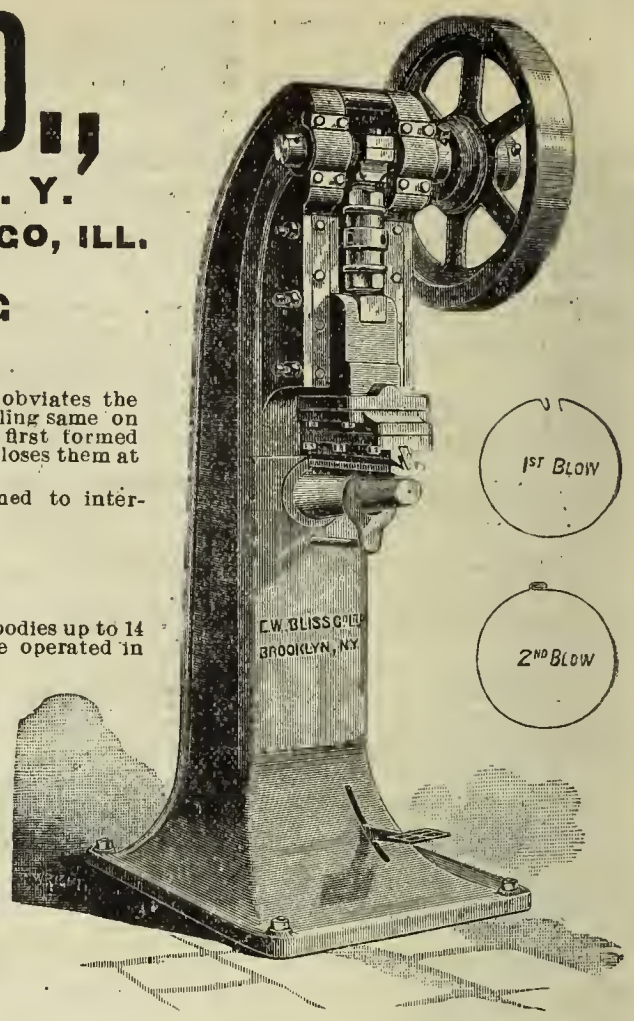
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



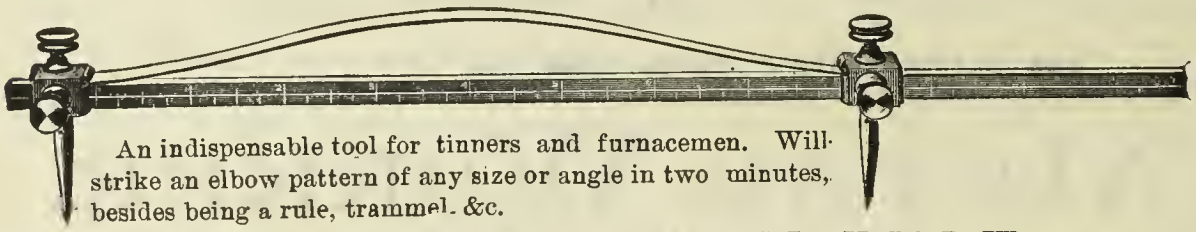
First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.



PRESSES, PUNCHES, SHEARS,

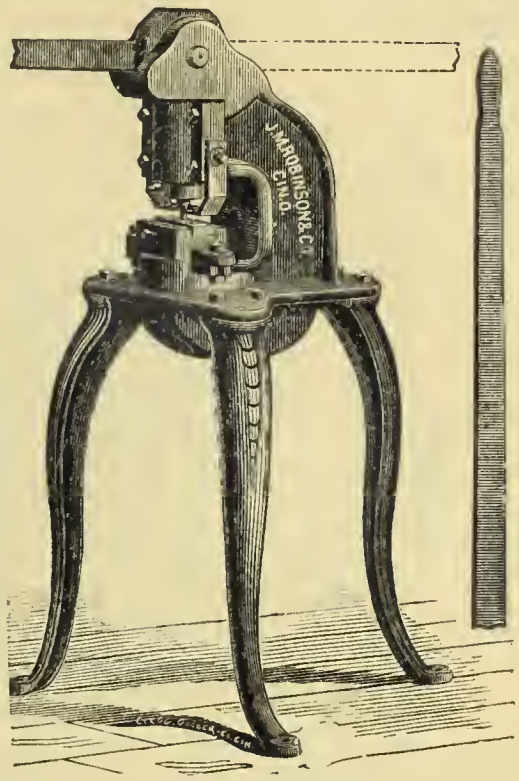
— MAGISTRATE (to witness): "Why didn't you go to the help of the defendant in the fight?"

Witness: "I didn't know which one of them was going to be the defendant."—*Philadelphia Inquirer.*

— THE JUDGE: "I hope I shall not see you here again."

Prisoner (who is arrested weekly): "Not see me? Why, yer ain't goin' to resign yer position, are yer?"—*Truth.*

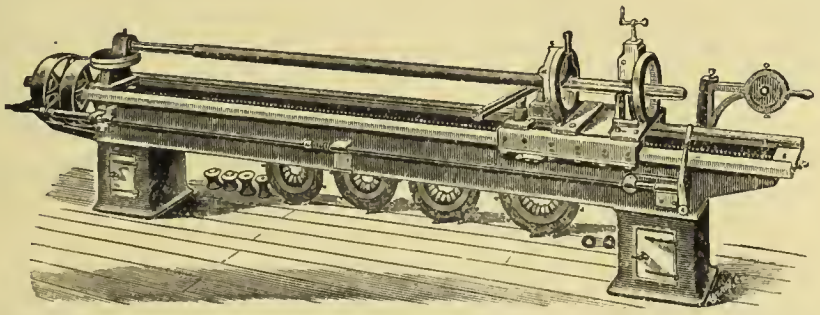
— BROWN: "Is young Flyingwedge practicing law?"



Jones: "I think not. He was admitted to the bar, but I think he's practicing economy."—*Vogue.*

— BOBBY: "Why doesn't the clock strike 13, Pa?"

Papa: "Because, Bobby, it hasn't the face to do it."—*Judge.*



PRESSURE EITHER FRONT OR REAR

is certainly more convenient when using a press than when the pressure is but one way. The former arrangement applies to the double acting press shown at the right. In an experience extending over a period of 36 years we have always found it profitable to make all our machines **CONVENIENT TO USE.** We make, in addition to this, a number of sheet metal working tools such as Bench Shears, Comb. Punch and Shears, Hand Lever Punching Presses, Power Punching Presses, Corner Iron Benders, Geared Power Punches, Hand Lever Shears, Bench Shears, Screw Presses, in fact Punches and Presses of all kinds, and the only "Globe Cornice Brake."

POCOCK'S ECCENTRIC
FORMING MACHINE.

We invite your attention to this new Former for Tinners' and Sheet-Metal Workers' Rolls, on which we claim rapidity of operation, superior construction and durability. The back roll is moved by eccentrics instead of screws, and can be changed instantly from the smallest circle to the passing of a straight sheet. It will flare metal easier and better than any other machine in use. You can get closer to front roll, therefore bend a smaller circle. For sale by all leading jobbers. Send for circular to

Adapted for Hard or Soft Coal.

Why not get our prices and send for descriptive circular?

BARSTOW STOVE COMPANY,
INCORPORATED,
BOSTON. PROVIDENCE, R. I. NEW YORK.

A FACT.

There is no "OLD STYLE" nor "OLD METHOD" Roofing Tin made in Philadelphia outside of N. & G. Taylor Company's Works.

Neither is there any old style nor old method "process."

Plates claiming to be such are made either through rolls or by acid flux.

We challenge contradiction.

Our Works are open.

A personal inspection of our manufacture and the manufacture of others will result in an increased use of the Genuine Taylor "OLD STYLE" brand, which is the **Standard Roofing Tin of America.**

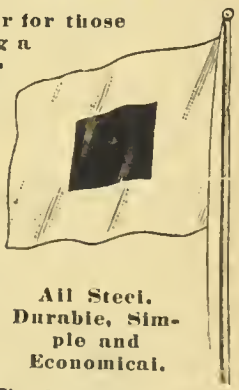
The Best Galvanized Iron

ought not to require specification, for a first-rate job of difficult work can't be done without it, and a first rate job costs less with it than an honest attempt at a first-rate job without it.

Every first-rate metal-worker probably knows that Apollo is true to gauge and flat and bendable.

It is of some little account that the top and bottom sheets of a bundle are cushioned against the bands; and so are delivered almost without blemish, just as the top and bottom sheets protect the inside sheets from the bands in other makes.



Apollo Best Bloom is the trade-mark. It costs a little more in large quantities. This is the only reason that other galvanized iron is sold at all.

Mr. William J. Baldwin, M.E., the Heating Engineer of New York, says in his trial of this boiler:

"The equivalent evaporation per pound of combustible from water at 212° Fah." "to 5 pounds pressure of steam is 11.02 pounds of water."

"The equivalent evaporation of water from 212° Fah. to 5 pounds steam pressure," "per square foot of average boiler surface per hour, is 2.368 pounds of water."

"You will note that when the rate of combustion is equal to 5 pounds of good an-" "thracite coal per square foot of grate per hour, that one square foot of average boiler" "surface evaporated sufficent steam for 10 square feet average radiation; an exceed-" "ingly high efficiency and rarely obtained in practice."

"The low temperature at which the gases of combustion entered the chimney," "ranging from 3 to 21 degrees above the temperature of the steam, shows that the" "boiler utilizes about all the available heat of the fuel."

IT has been said that in America TWO CLASSES of Stoves and Ranges are sold, viz.:

"GARLANDS"

— AND —

OTHERS.

At the very head and front of the "Others" stands our new line of

"MICHIGAN"

Stoves and Ranges, which are unquestionably the latest, handsomest and most artistically designed Stoves and Ranges to be found upon the market at anything like the price at which they are sold.

They are made under our own supervision; by same workmen and out of the same material from which "Garlands" are made, and this fact of itself should be sufficient to cause them to be preferred by discriminating merchants and consumers, as against all other brands, excepting the invincible line of "Garlands."

The Largest and Best Equipped Steel Range Manufacturers in the World.

THE PENINSULAR STOVE COMPANY,

DETROIT, CHICAGO, BUFFALO.

THE ANNOUNCEMENT in a recent issue of THE METAL WORKER that we are soon to place on the market a Steel Climax Range having prompted the inquiry on the part of some of our patrons as to whether we design thereby to abandon the manufacture of our Celebrated Standard Climax Range, which has maintained supremacy for several years as an established leader of its class and against which not a single complaint has been filed in our office, we desire by this to inform the trade that the reputation of the Climax Range and constantly increasing demands for same is such as to preclude the possibility of abandonment if we felt disposed to do so. The Range, we are pleased to say, is more popular than ever, and the manufacture of same will be continued in all its varied conventional styles and sizes, and we sincerely trust that none will be deceived into a belief that an ***imitation*** now being offered to the trade is as good as the initial construction, which can only be procured of

TAPLIN, RICE & CO., AKRON, OHIO.

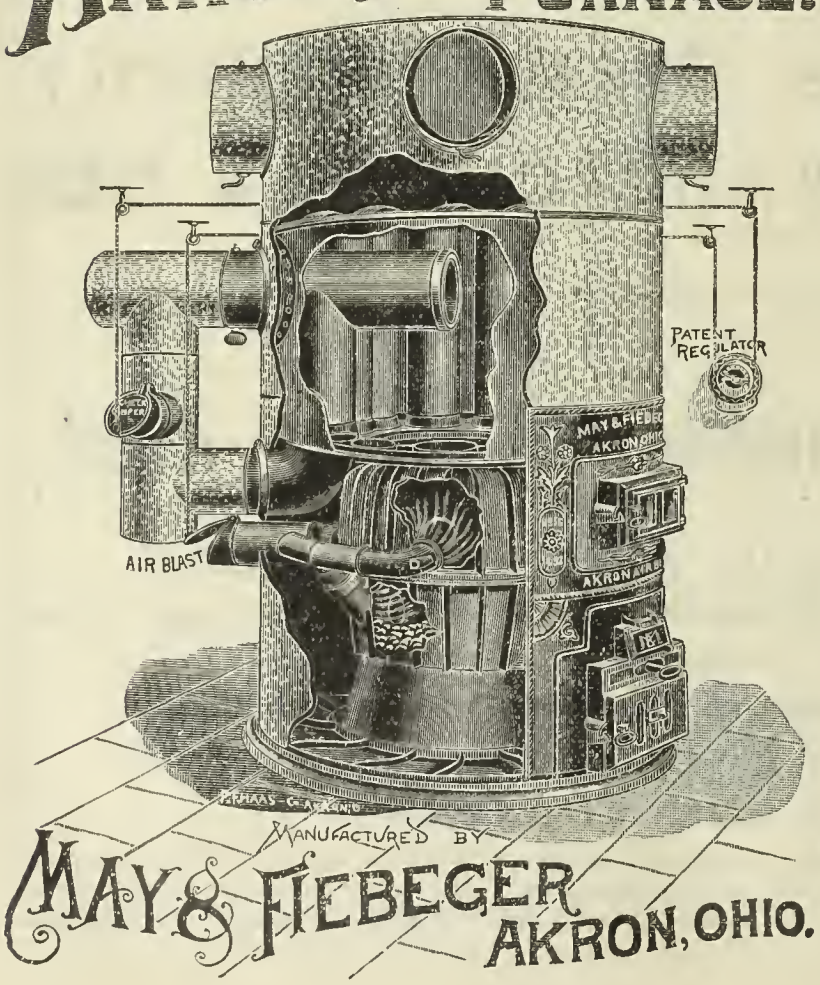
Guaranteed to be more economical, quicker in circulation and more durable than any heater in the market. Hundreds are in use and doing good service that were put in 25 years ago. Send for our illustrated catalogue, "**Health and Comfort in the Home Circle.**"

Information

—ON—

School Work.

THE heating, ventilating and sanitary work in Schools, Court Houses and like Public Buildings is a branch of engineering by itself and should be undertaken only by those who are trained to the work, working from detail plans and specifications and using apparatus manufactured especially for such work. This comes under a special department of this company, managed by competent engineers and superintendents and is undertaken only from the home office. If any dealer has knowledge of where a system may be installed or can secure the contract for its installation a liberal percentage will be allowed and we will carry out the practical part of the matter to a finish.



CORRESPONDENCE IS INVITED.

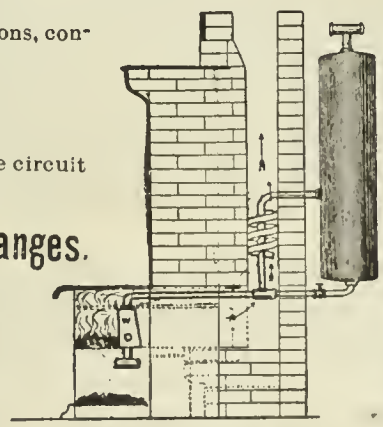
Glenmore Spiral Hot Water Generator, Sectional View.

THE GLENMORE

Spiral Hot Water Generator.

(PATENTED.)

For General Heating Purposes, but Especially Adapted to House Heating.



COMMENDATORY POINTS:

Simple construction. Practically composed of two sections, consequently few joints and nothing to give out.
Large heating surfaces
Products of combustion fully utilized.
Instantaneous generation of hot water.
Free and easy circulation.
Easily cleaned fire surfaces.
Hot water may be drawn off at any point along the pipe circuit without materially affecting the heating service.
Grate conducive to economy in fuel.

Spiral Water Back Attachment for Kitchen Ranges.

By utilizing waste heat, this water back extends the capacity of a kitchen boiler, and makes it a valuable heating auxiliary, especially in spring and fall, when the regular heating apparatus is too powerful.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

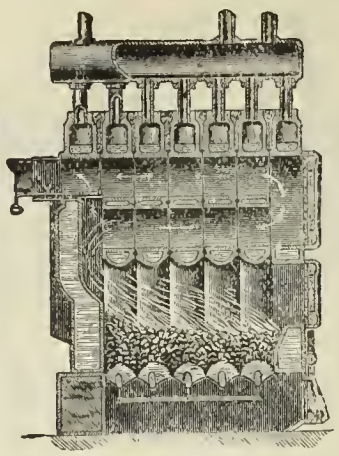
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

— A BUMP FOR LOCALITY.—A small boy from Lansing was in Detroit not long ago with his mother, for the first time. It was also her first visit to the city, and she was almost as much interested in the sights and as confused by the bigness as the boy was. They had been out with the head of the family and had returned to their hotel, and the boy was looking out of the window with unabated delight.

"Say, mamma," he said after some time, "if I should go down this street seven squares and up the next one three squares and out the next one six squares, then go ahead five squares, where would I be?"

"Really, Frank," she replied, "it's more than I can tell you. You'd better ask your father."

"I don't have to," said the boy proudly. "I know."

"Oh, I guess you don't," she smiled.

"But I know I do," he persisted.

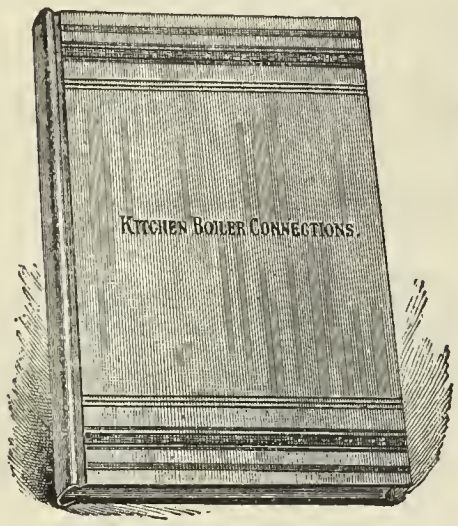
She was a little curious to learn if the boy had picked up any idea of the city, and so she humored him.

"Where would you be?" she inquired.

"I'd be lost," and she believed him thoroughly.—*Detroit Free Press.*

— HE COULDN'T, REALLY.—Sam: "Let me have a twenty for a week, can't you, old fellow?"

Robert: "Why don't you raise it on that diamond ring?"



Sam: "Well, you see, it was presented to me by my dead wife, and I wouldn't like to give it up."

Robert: "Same here; my money was presented to me by my dead father, and I don't like to give it up, either."

— "YES, young ladies," said the professor, "Pallas Athene, the Grecian goddess of wisdom, was unmarried." And from that day the goose wondered why those girls wouldn't study.—*New York Recorder.*

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth

Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

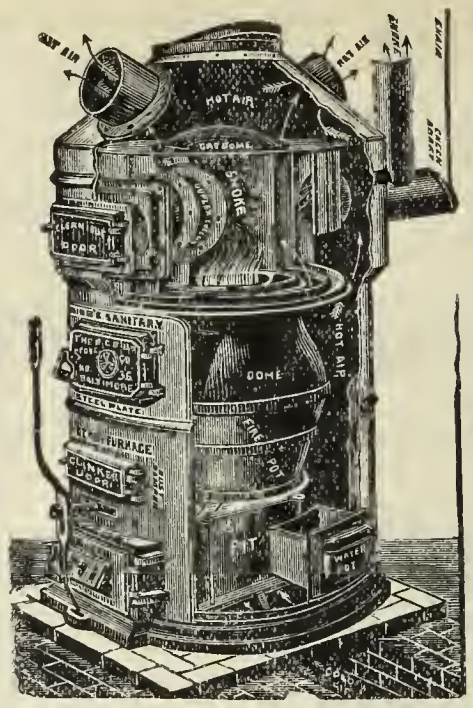
The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*



Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

A Blow at Eight-Hour Laws.

The Supreme Court of Illinois has decided unanimously that the eight-hour law for women which was enacted in 1893 by the Legislature of that State is unconstitutional. The act expressly prohibits women from working in any manufacturing establishment more than eight hours in any one day. The court holds that a woman has the right to contract to work as many hours in a day or a week as she may see proper. The mere fact of sex does not justify the law making power to restrict the right of any person to dispose of her labor as she sees fit. But the decision goes further than this and lays down the broad principle that an act which abridges the freedom of contract between workman and employer in a lawful occupation is unconstitutional. In far-reaching results this decision is regarded as exceedingly important. It is stated to be the first decision in the United States against eight-hour laws, and thus presents a new obstacle in the path of the movement for shorter hours. Labor is held to be property and the laborer is declared to have the same right to sell his labor and to contract with reference thereto as has any other property owner. The declaration that a legislature is powerless under the State constitution (which conforms on this point to that of the United States) to interfere with the freedom of contract, strikes at all enactments which have been made for the purpose of shortening the hours of labor. It therefore blasts the hopes of those labor reformers who seek to bring about a new order of things through legislation. They will have to work in another direction. Much progress has been made in the creation of a strong public sentiment in favor of shorter hours of labor, and the movement seems destined to continue to grow in strength. But the short cut through an act of legislature has been clearly shown by this decision not to be feasible.

Displacing Planished Iron for Locomotive Jackets.

The economies forced upon railroad companies by their reduced earnings are leading to some remarkable changes. One of these is the substitution of cheaper sheet iron for the planished iron used as locomotive jackets from time immemorial. The cheap sheet iron is either japanned or painted. Not only is an important saving thus effected in the first cost of the jacket, but its subsequent care is much less expensive. Planished iron requires constant attention, being frequently oiled and rubbed, taking much of the fireman's time. The japanned or painted jacket falls to the care of the wipers or hostlers in the round houses. Numerous Western railroad companies have made the change on freight engines, and some very prominent systems are now extending it to their passenger locomotives. A heavy burden was taken from firemen's shoulders when the extensive use of brass ornamentation on locomotives was abandoned, and this later step is in the same line, but the prime consideration is not the diminution of firemen's labors, but economy in the cost of maintenance. An important outlet for the production of planished sheet iron is thus being seriously curtailed.

Nikola Tesla's Misfortune.

There is something singularly regrettable, and even pathetic, about the misfortune that has recently overtaken Nikola Tesla, the electrician, in the destruction by fire of all the mechanical instruments and scientific apparatus in his experimental laboratory, which it had taken him nearly half his lifetime to perfect. It is a loss which cannot be estimated in dollars and cents, and one, moreover, which will be felt in a measure by the entire scientific world, in which Tesla holds so high a place. The wiping out at one sweep of the work of years is a blow which must naturally strain the fortitude of a man to the breaking point. As parallel misfortunes two well-known historical incidents come to mind. The destruction by his pet dog of the sheets containing the result of precious calculations and investigations to which Sir Isaac Newton had devoted more than two years of labor, and the crushing loss which befell Thomas Carlyle in the burning by an ignorant maid servant of the manuscript of his "History of the French Revolution," lent by him to his friend, John Stuart Mill, are cases in point. Both losses were borne with the fortitude which characterized those great men. Newton set to work to travel afresh over the old ground, and regained all he had lost, and more, in the pursuit. The later-born philosopher rewrote his famous history from memory, and declared at the end that it was vastly superior to the original. So the result may be in the case of Tesla.

The Work of Reconstruction.

Nikola Tesla has youth in his favor and is credited with the possession of a full share of the qualities of grit and persistence which are inseparable from the best kind of genius. He has, too, the advantage of beginning over again with a full knowledge of all his previous steps and processes. Provided health and life are spared, we can, therefore, look to him with confidence for much more wonderful work in the field of electrical research which he has made his own. The loss of time which will inevitably occur before the special instruments necessary to his work can be replaced, and the results of former experiments be recovered, is, however, to be regarded as a calamity, coming just at a time when Tesla was apparently so near perfecting his discovery of the means of transmitting electricity without a wire, not to mention the other important investigations on which he is engaged. He commands universal sympathy in his present misfortune, and this alone should prove a stimulus in the arduous work of reconstruction which now lies before him.

The subject of the removal of New York City's garbage is still an open question. Notwithstanding the investigations of the special commission sent out last year by Mayor Gilroy for the purpose of determining the best systems followed in other cities, the adoption of a plan which will be entirely effective under the conditions existing in New York seems to be as difficult of solution as ever. At any rate, nothing definite has yet been done in the matter. The outrageous practice of dumping the city's refuse into the sea, which was strongly condemned in the report rendered by the special commission, is still being continued.

Plans have been filed with the Board of Port Wardens, in Philadelphia, by the American Sugar Refining Company for an iron pier 548 feet in length by 75 feet in width, to be built on the Delaware River front, to take the place of three old piers now existing between South and Bainbridge streets. This will be by far the finest pier on the river.

The Brosnan Molding Machine.

In this molding machine provision is made for drawing the pattern by cam motion. A simple operation by hand or power communicates a partial revolution which raises the pattern, and after the sand is applied and compressed, a proper motion of the cam shaft in the opposite direction draws the pattern down from the stripping plate. A positive stop arrests the revolution at the right point when the pattern is up. The arrangement holds the pattern plate alternately at the respective ends of its motion first with the pattern up and then with it down without requiring any fastenings.

The frame A is provided with vertical ways or guides A′, which receive long, straight parallel arms B′, rigidly bolted to and extending down from a rising and sinking table or pattern plate, B, on which the pattern M is secured. A small pinion, C, is mounted on a fixed stud, A^2, supported on the framing A, and by means of a light fly wheel, C′, and a crank handle, C^2, is turned at will in either direction. The cam shaft D carries the eccentric cams D′ D′ of equal size and similarly set on the shaft. A large gear, D^2, on one end of this shaft is engaged by the pinion C. In the adjustable and exchangeable stripping plate E engage T-headed screws E′, which extend downward through holes in the frame. They are stiffly set by means of the nuts E^3, E^4.

The under face of the pattern plate B presents nicely finished surfaces adapted to receive the action of the eccentric cams D′. By giving the crank C^2 a few strong turns in one direction, the cam shaft is partially revolved, and the pattern plate B is raised to the required position, protruding the pattern M to the required extent through the carefully executed aperture in the stripping plate, and by means of the long straight guide arms B′ held firmly against tilting. The flask, not shown, is applied and the sand introduced, rammed and struck, by hand or by machinery, in any ordinary or suitable manner. Now the operator turns the crank C^2 a few revolutions in the opposite direction, with the effect to lower the pattern plate and its attachments, including the pattern M. The eccentric form of the cam and the fact that the crank C^2 is started from a state of rest insure that the descending motion of the pattern shall be slow at the commencement. The guides or vertical ways A′ steady the movement, so that there is no trembling or irregularity laterally, and the pattern is drawn smoothly out of the sand, the first part of the motion being slow and the later portion of the descending movement rapid. A projection, D^3, is cast in the required position on one side of each cam.

The stops B^2 are fixed in the required positions on the under face of the pattern plate B. When the cam shaft has been sufficiently rotated to bring the cams into their highest position the projections D^3 strike the stops B^2 and insure that the motion is arrested at that point.

A grooved pulley, D^4, is keyed on the end of the shaft D, and carries a chain, G, by which a sufficiently heavy weight, H, is suspended. The force thus received tends to turn the cam shaft in the direction to lift the pattern plate and its attachments. The weight of H should be less than is required to balance the load when the eccentric cams are at their mid hight, but it is more than sufficient to lift the load when the cams are quite up. The arrangement offers little friction, and allows the attendant to turn the crank with ease alternately in opposite directions, as required, and insures that the pattern plate shall be held reliably without other fastening at the two ends of its motion respectively. When it is up it will be held up by reason of the fact that the eccentric cams are on their centers, and the gravity of the counterbalance weight is of full effect, and when it is down it will remain down by reason of the fact that the counterbalance weight is not sufficient to overcome the gravity of the plate and its attachments in addition to the friction when the parts are in that position. This machine is the design of M. J. Brosnan of 518 Henry street, Brooklyn, N. Y.

THE BROSNAN MOLDING MACHINE.

The American makers of oilcloth are about combining because of increased competition and the reduction of tariff duty. A corporation having a capital stock of over $3,000,000 is being formed for this purpose.

The promoters of the proposed tunnel under the channel between England and France have announced their abandonment of the project owing to the opposition of the Government and the military authorities of Great Britain.

The Richards Molding Machines.

We here illustrate two forms of molding machines designed by Willard F. Richards of Buffalo, N. Y. Mr. Richards furnished the designs from which were built the four large molding machines now successfully in operation at the works of the Westinghouse Air Brake Company, Pittsburgh. Two of these machines turn out 265 complete molds per day, doing the work of 26 molders. The machine shown in Figs. 1 and 2 contains an abutment or stationary ramming block, a table for the flask to be rammed, arranged underneath the block, and a follower whereby the flask is moved toward the block for ramming. Projecting from the base A of the machine are two standards, A^1 A^2, connected at their upper ends by a cross piece, A^3. The horizontal flask supporting table B turns on the standard A^1, and consists of four upright rectangular casings, B^1, as shown in Fig. 2. These casings are carried by a central hub, as sleeve B^2, journaled on a fixed column, C, which surrounds the standard. The hub is supported on the base by a ball bearing, *d*. A horizontal follower, E, is arranged to move vertically in each chamber, B^1, and is provided on its under side with an actuating rod, *e*. Each chamber is open at its upper end, and formed in its lower end with an opening for the passage of the follower rod. The follower of each chamber is guided on upright rails *g*, arranged in the corners of the chamber and fitting into angular guides *g'*. Open rectangular plates H rest upon pins *h*, projecting above the upper edges of the chambers, and *i* are the usual stripping plates. The pattern J is secured to the upper side of the follower, and the half-flask K rests upon the stripping plate *i*.

The stationary ramming block L is secure to the under side of the cross piece d^3. Below the table B is the upright actuating cylinder M, the piston rod *m'* passing through the stuffing box of the cylinder and having its upper end located in the circular path of travel of the rods of the several followers E. The upward movement of the piston rod can thus be imparted to the follower rod standing above it. The piston is operated by steam or compressed air admitted through the pipe *n*. Each follower is provided with a pair of bell crank levers, *o*, for retarding its descent in withdrawing the pattern from the mold. These levers are mounted on horizontal pivots secured to a fixed upright plate arranged within the chamber of the follower. The upper arms of these levers bear loosely against the under side of the follower and are provided at their ends with bearing rollers for reducing the friction. The lower vertical arms of the levers are connected by links *q* with a cross head, Q, which moves in radial guides q^2 arranged within the chamber below the follower. The radial slides R are arranged between the guides q^2 and bear loosely with their rear ends against the inner ends of radial adjusting screws or bolts q^3 arranged in the cross head Q, so that the movement of the slide is imparted to the cross head, and *vice versa*. The inner ends of the several slides pass through openings formed in the adjacent walls of the chambers B^1 and are provided with anti-friction rollers *r* which bear against the face of a stationary horizontal cam, S, secured to the column C, the adjacent portion of the hub of the rotary table being recessed or cut away to clear this cam. The slides R are each provided with a longitudinal slot, *r'*, for the passage of the follower rods.

The wide, concentric portion of the cam S is made of such a radius that when a slide bears against such wide portion the slide is in its outermost position, and the upper arms of the bell crank levers connected with the slide stand in a substantially horizontal position, so as to support the follower resting thereon in the normal position shown in Fig. 1. The narrow portion of the cam is made of such a radius that when a slide rides over the same it is allowed to move inwardly under the weight of the follower exerted on the slide through the bell crank levers and the cross head Q, thereby permitting the follower to descend sufficiently to withdraw the pattern from the mold. The narrow portion of the cam is preferably arranged toward the rear side of the machine, as shown, so that the followers are allowed to descend to the position for stripping the pattern on that side of the machine only.

The rotary table is locked in place, after bringing one of the followers under the ramming block. A spring catch operated by a treadle, T, is employed for this purpose.

In the operation of the machine, when the rotary table is turned so that one of the followers E stands under the ramming block, the slide R co-operating with that follower is in its outermost position and the follower is sustained in the position shown in Fig. 1, being nearly flush with the upper edge of its chamber. The pattern secured to the follower projects through the opening in the stripping plate and the supporting plate of the latter, and the half flask rests upon the stripping plate, having been previously filled with sand in the usual manner. Upon admitting steam to the actuating cylinder the piston in the latter rises and strikes the lower end of the follower rod, moving the

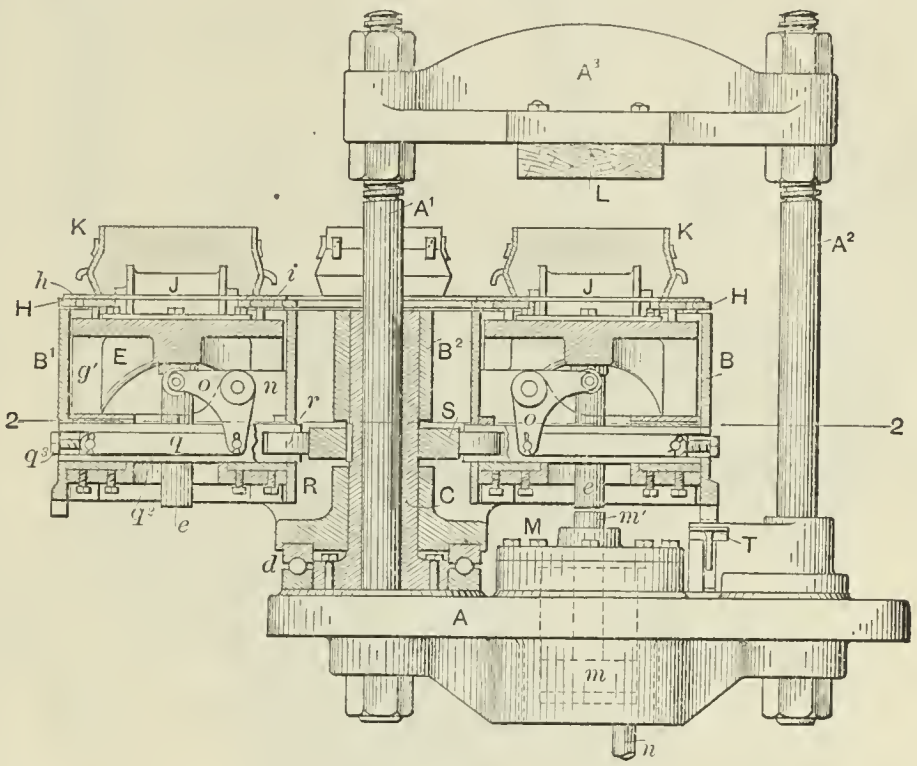

Fig. 1.—Sectional Elevation.

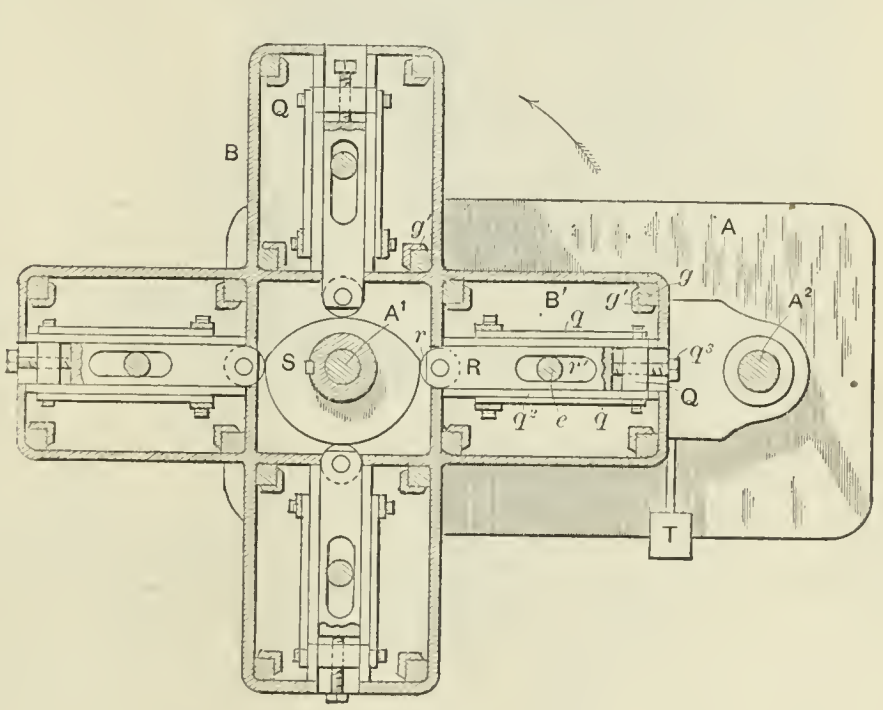

Fig. 2.—Sectional Plan on Line 2 2 of Fig. 1.

THE RICHARDS MOLDING MACHINES.

follower, together with the superposed supporting frame, the stripping plate and the flask, toward the ramming block, thereby forcing the sand in the flask against the ramming block and packing it around the pattern. Upon now allowing the steam to exhaust from the actuating cylinder, the follower with the superposed parts descends to the position shown in Fig. 1, when its further descent is prevented by the upper arms of the elbow levers *o*. In this position of the parts the frame which supports the stripping plate and half flask rests upon the pins *h*. The rotary table is now unlocked and given a quarter turn in the direction of the arrow in Fig. 2, so as to bring the partially lowered follower on the rear side of the machine and the next follower under the ramming block. This quarter turn of the table brings the slide of the follower opposite the narrow portion of the cam S, allowing the latter to move inward and the follower with the pattern attached thereto to descend to its lowermost position, thereby withdrawing the pattern from the flask and completing the half mold. The depressed follower remains in this position until the rotary table is again shifted for presenting another unrammed flask to the ramming block, when it is again raised to its normal position by its slide riding over the wide portion of the cam S and swinging the bell crank levers into the position shown in Fig. 1. The flasks on the several followers are in this manner successively presented to the ramming block and rammed, and are then moved aside for withdrawing the pattern from the mold.

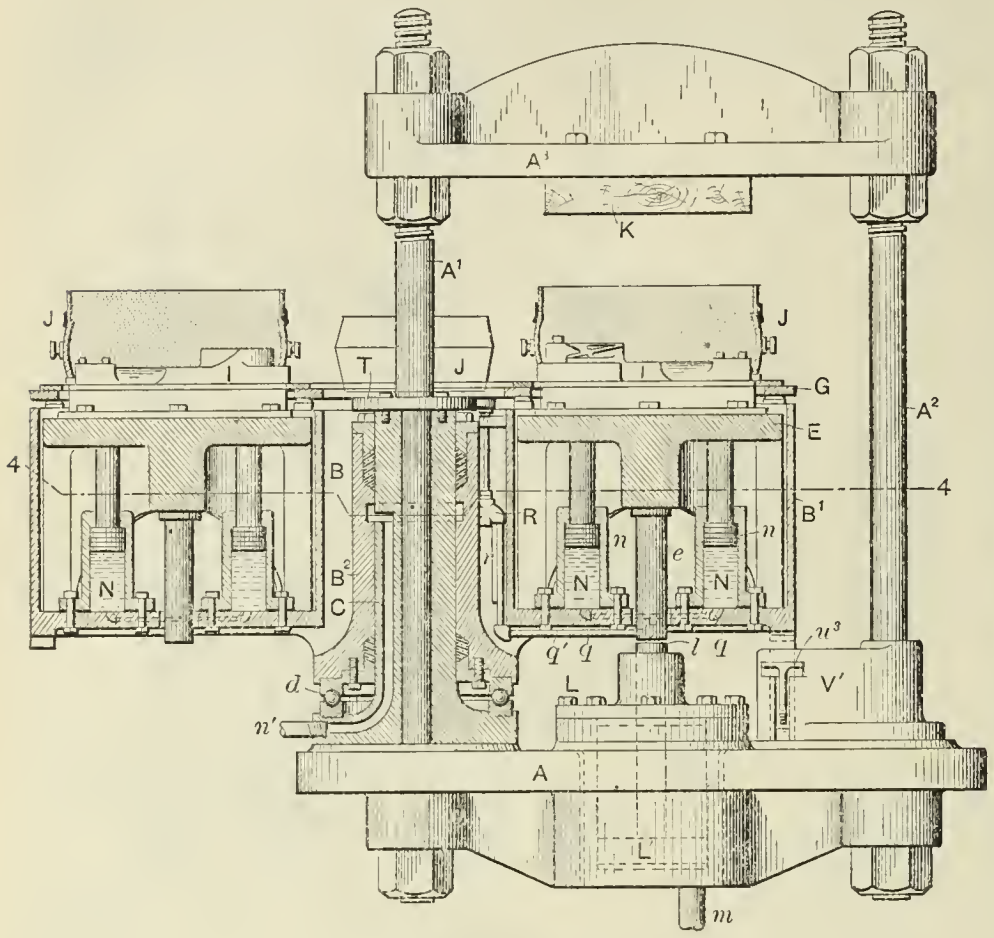

Fig. 3.—Sectional Elevation.

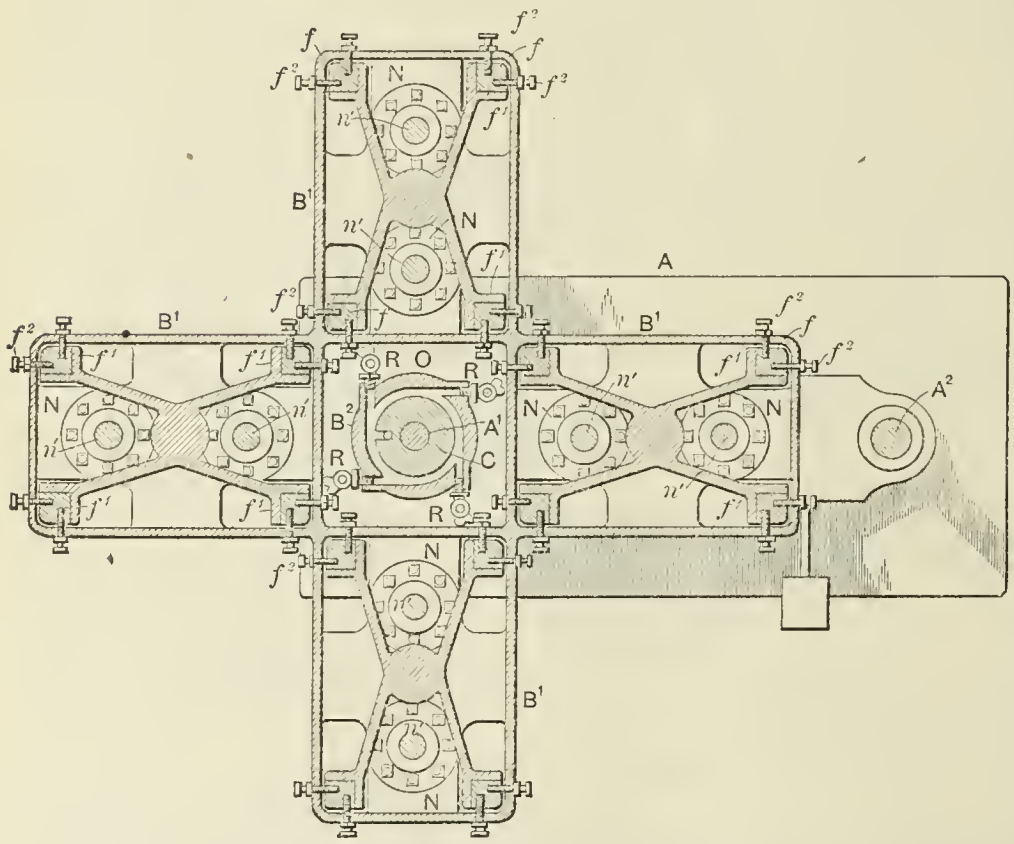

Fig. 4.—Sectional Plan on Line 4 4 of Fig. 3.

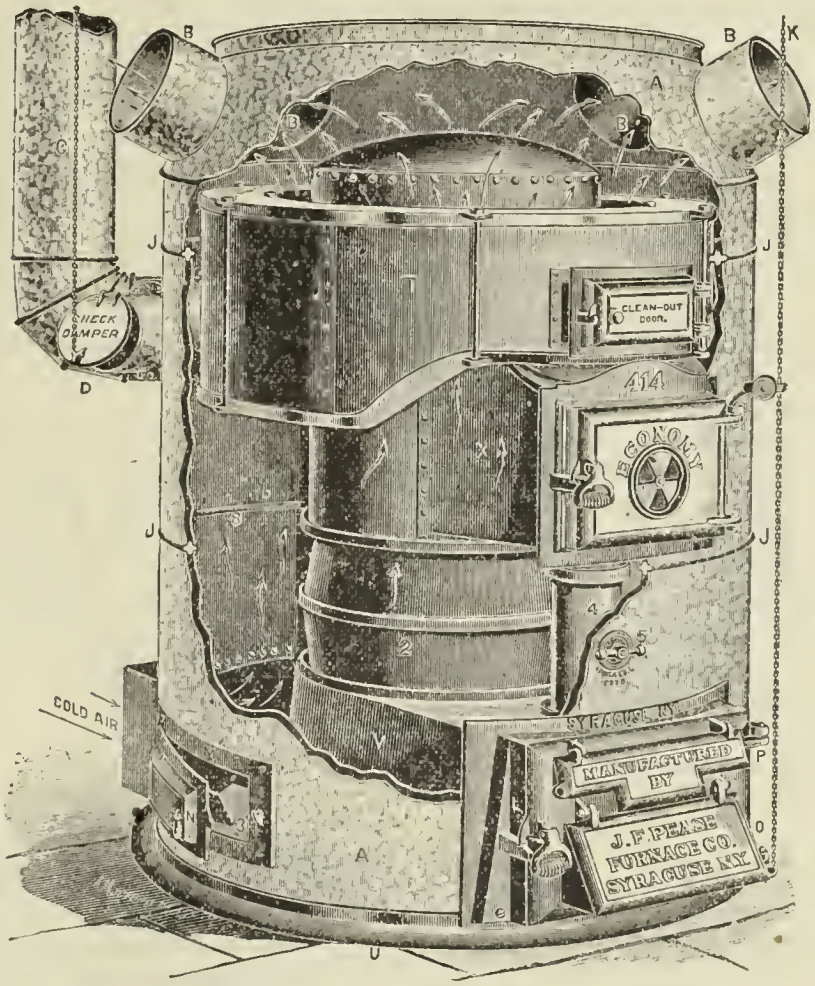
THE RICHARDS MOLDING MACHINES.

The machine shown in Figs. 3 and 4 is similar in its general arrangement to the one just described. In each of the chambers B^1 is placed a follower, E, whose rod *e* is actuated by the piston rod *l* of the cylinder L. The follower of each chamber is guided on upright rails *f*, Fig. 4, placed in the corners of the chamber and fitting into the angular guides f^1. The rails are adjustable by means of the bolts f^3. The supporting plates G rest upon pins *g*, and the stripping plates are secured to the upper side of the supporting plates. The arrangement of the pattern I, the half flask J and the stationary ramming block K will be understood from the drawings, as will also the method of supporting the platforms so they may be turned around the standard A^1. In each of the chambers B^1 are arranged a pair of upright hydraulic cylinders, N N, for retarding the descent of the follower after ramming the sand in the flask. These cylinders are located on opposite sides of the follower rod and in each cylinder is arranged a piston, *n*, the rod *n′* of which extends through the upper head of the cylinder, and is adapted to bear loosely with its upper end against the under side of the follower, so as to resist the downward movement of the latter, but permit it to move upward out of contact with the rods of the plungers. Formed in the hub of the rotary table B is an annular inlet chamber, O, with which the supply passage formed in the column C communicates. The lower end of this passage is connected with the pipe *n′*.

Each hydraulic cylinder is provided at its lower end with a combined induction and eduction pipe, *q*, and the pipes of the two cylinders of the same chamber communicate with a main pipe, *q′*, which is connected with the annular inlet chamber O. Each of the main pipes *q′* is provided with a three-way valve, R, for controlling the passage of the water to and from the hydraulic cylinders. To each of these three-way cocks is connected an outlet or waste pipe, *r*. The ways of each cock are so arranged that upon turning its plug in one direction the main pipe *q′* is placed in communication with the annular inlet chamber O and the waste pipe *r* is closed, while upon turning the plug in the opposite direction communication is established between the main pipe and the waste pipe and cut off between the main pipe and the inlet chamber.

The stop cocks are automatically controlled by the stationary cam T fixed to the standard A^1.

The smallest radius of the cam is arranged toward the rear side of the machine, so that when the arm of a stop cock rides over such narrow portion of the cam, it is caused to move inward under the pressure of its spring and turn the plug of such stop cock in the proper direction to place the cor-



responding hydraulic cylinders in communication with the waste pipe *r* of the cock, thereby allowing the water to escape from the cylinders and permitting their plungers and the follower and superposed parts to descend by gravity. The portions of the cam, which face the front and sides of the machine are concentric with the axis of the rotary table, and their radius is sufficiently large to retain the actuating arms of the opposing stop cocks in the proper position to cut off communication between the waste pipes of such cocks and the corresponding hydraulic cylinders, and establish communication between the latter and the inlet chamber O. By this arrangement, only the stop cock of the chamber standing on the rear side of the machine is opened so as to allow the follower to descend, while the cocks of the remaining three chambers are kept closed, so as to prevent the descent of their followers.

When the rotary table is turned so that one of the followers E stands under the ramming block, the stop cock controlling the passage of the water to the hydraulic cylinders N of such follower allows the water to enter the cylinders, and the plungers of the latter are therefore raised and caused to support the follower in the position shown in Fig. 3. In this position the follower is nearly flush with the upper edge of its chamber, the pattern secured thereto projects through the opening in the stripping plate and the supporting frame G of the latter, and the half flask rests upon the stripping plate, the flask having been previously filled with sand in the usual manner. Upon admitting steam to the actuating cylinder the piston in the latter rises, and, striking the lower end of the follower rod, moves the follower, together with the superposed supporting frame, the stripping plate, the pattern and the flask, toward the ramming block, thereby forcing the sand in the flask against the ramming block and compacting it around the pattern. Upon allowing the steam to exhaust from the actuating cylinder the follower, with the superposed parts, descends to the position shown in Fig. 1, when its further descent is arrested by the rods of the elevated plunger *n*. In this position of the parts, the frame which supports the stripping plate and half flask rests upon the pins of the chamber B. The table is now unlocked by depressing its foot lever u^3 and is given a quarter turn so as to bring the partially lowered follower on the rear side of the machine and the next follower under the ramming block. This quarter turn of the table causes the stop cock R of the first mentioned follower to be turned in the proper direction to allow the water to escape from the hydraulic cylinders of said follower, and the latter now descends slowly by gravity, thereby withdrawing the pattern from the half flask and completing the half mold. The depressed follower remains in this position until the rotary table is again shifted to bring another unrammed flask under the ramming block, when its stop cock is again opened by its actuating arm riding over the wide portion of the cam and the follower is raised to the position shown in Fig. 1 by the water entering its hydraulic cylinders N and elevating the plungers in the latter. The several followers are thus successively brought under the ramming block and raised for ramming the superposed flask.

The Secretary of the Interior has decided in favor of the Portage Lake & Lake Superior Ship Canal Company in a suit brought against them by Angus Smith and others to set aside the certifications of lands made over to the canal company by the State of Michigan as a grant in compensation for the construction of certain public works. The property affected amounts to 68,647 acres, and includes a tract of iron lands in the Gogebic range.

The 1895 Pattern Economy Furnace.

The accompanying illustration shows the 1895 Pattern Economy furnace, brought out by the J. F. Pease Furnace Company, Syracuse, N. Y. The casing is shown broken away, revealing the internal construction and illustrating the principal features of this new form of furnace. It is specially designed for use in low cellars and is constructed to burn either hard or soft coal or coke. The principles of construction and operation are similar to those of the other furnaces made by the firm, the casing, however, being 9 to 12 inches lower according to size, while the castings of the heater are made somewhat lighter, though the steel portions are kept full weight. The furnace is therefore not quite as heavy as the regular style and is sold at a lower price. The casing is provided with an inside lining of tin to prevent waste of heat. The sides of the steel combustion chamber T are constructed of No. 12 gauge plate, the head and top being of No. 10. The fire pot is made in two sections with cup joints, the combustion chamber resting in a cup joint on top of the second section. The dome is surrounded by a single steel plate radiator the sides of which are made from No. 18 steel. This is securely connected to the inclined top of the feed chute X by cementing the cup joint. The direct connection thus made, it is pointed out, prevents any escape of gas or smoke into the cellar when the door is opened. The bottom radiator is of ogee form, which reduces the friction in the air circulation and secures a larger circulation up between the radiator and chamber. The smoke pipe C is connected to the rear portion of the radiator directly opposite the entrance. The check damper D, located on the smoke pipe, is regulated by a chain which runs to any room from which it may be desired to control the furnace. The lift draft door O on the ash pit door L is likewise regulated. The McClave T grate, hollow bar revolving grate or anti-clinker grate can be used as desired. In describing the operation of this furnace the manufacturers point out that the products of combustion ascend into and fill the steel chamber T, and the smoke and gases pass through the opening at the top of the feed chute X, which is somewhat higher than the opening of the feed door, and circulate through the radiator, the products of combustion finally escaping through the smoke pipe C. It is mentioned that great care is exercised in the construction of the furnace to make it absolutely gas tight, while the escape of dust through the ash pit door when shaking the grate is prevented by the use of the patent dust pipe 4. When the damper 5 is turned the dust caused by shaking the grate is drawn up into the chamber by the draft. The radiator, it is said, can be very readily cleaned with a scraper which is sent for the purpose. It operates through the clean out door and the smoke pipe collar in the rear.

The 1895 Economy Furnace.

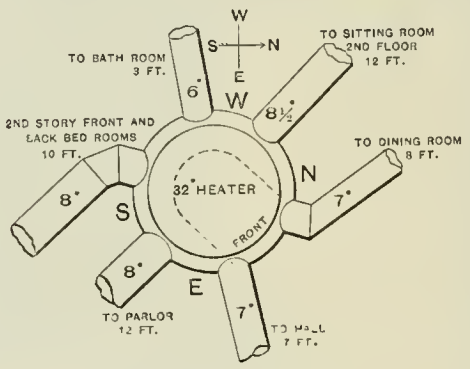
The Boyden Power Brake Company, Baltimore, Md., have decided to take an appeal from the decision rendered last week by Judge Morris in favor of the Westinghouse Air Brake Company, in the suit brought by them against the Boyden Company for alleged infringement of a patented air brake mechanism

THE LETTER BOX.

Elbow Pattern.

From C. C., *Livermore, Cal.*—I would like some information regarding how to put a square elbow together. I can describe the pattern in the usual manner, but when it comes to allowing for edges I cannot get it right. I only turn over the upper part of the lower piece, and that throws the elbow out of bevel.

Answer.—We think it is the usual custom with tinners when making elbows, as for stove pipe, to turn the large part of the elbow so the entire edge can be turned in, especially at the heel. The small part of the elbow has the edge turned out, so as to receive the outer edge. For small elbows, ss those made of tin, that are to be soldered, the throat part of the small end is usually turned out, and the heel part of the large end turned in. Just how the patterns should be described would depend perhaps on the method of working. If difficulty was experienced in putting the two parts together after the edges were properly turned, or the desired angle was not obtained, it might be well to describe the patterns so the large end would have a little more than the required bevel, and the small end a little less. When describing patterns of any kind it is usual to obtain the net patterns, and then make due allowances for edges outside of the boundary lines.



Allowance for Iron Pipe.

From C. C., *Livermore, Cal.*—Is there any set rule for each thickness of sheet metal in making round pipe? That is, how much to allow on the end the pipe goes in, or how much to take off on the end that goes in the pipe.

Answer.—There are general rules in use among tinners for making ordinary round pipe. Thus for No. 24 iron it is usual to allow $\frac{1}{4}$ inch, for No. 26 iron about $\frac{3}{16}$ inch, and for tin pipe say $\frac{1}{8}$ inch, depending on the thickness of the tin. Whether the allowance is to be given to the large end or taken from the small is a vexed question among tinners. When a crimping machine is used the two ends of the pipe are made the same size, the machine making the reduction. When making round pipe from heavy iron it is usual to allow three and a half times the thickness of the iron at each end, not counting for the lap. Thus supposing a certain pipe was to go inside of a flange, the iron would be marked three and a half times the thickness of the iron less than the circumference. If the inside of the small end of a pipe was to be made a certain diameter, three and a half times the thickness of the iron would be added to the circumference. That the large end of this pipe should allow another joint to enter, the large end should have added to it another three and a half times the thickness of the iron. Thus the large end of the pipe would measure in the flat seven times the thickness of the iron more than the small end.

Trouble With Furnace.

From TINSMITH, *Philadelphia.*—In reply to "Dealer," who reports trouble with furnace in *The Metal Worker* March 2. Having had 24 years' experience, I would suggest in the first place that the size of the pipes be reduced, as the furnace has not the capacity to fill them. 2. The pipes are too close together; they should be divided more evenly around the top of the furnace so that one cannot rob

Trouble with Furnace.

another. 3. Do away with the cold air duct and ventilate the cellar front and back. I submit the plan of a furnace job I completed a few weeks ago, during the cold snap, in one of a row of houses situated the same as the one in which my fellow mechanic is having trouble. All of my pipes are smaller and I have no cold air duct; all I do is to ventilate the cellar. I have tested the job to see what temperature I could raise, and the results were more than satisfactory. The average temperature on the first floor was 70°. By throwing one-half of the heat to the sitting room into the hall a temperature of 94° was shown in the hall outside of the sitting room door 8 feet away from the register. The house was a two-story seven-room residence and I used a first-class 32-inch furnace. I would like to hear if some of my fellow mechanics can do better than that with large heat pipes and cold air ducts.

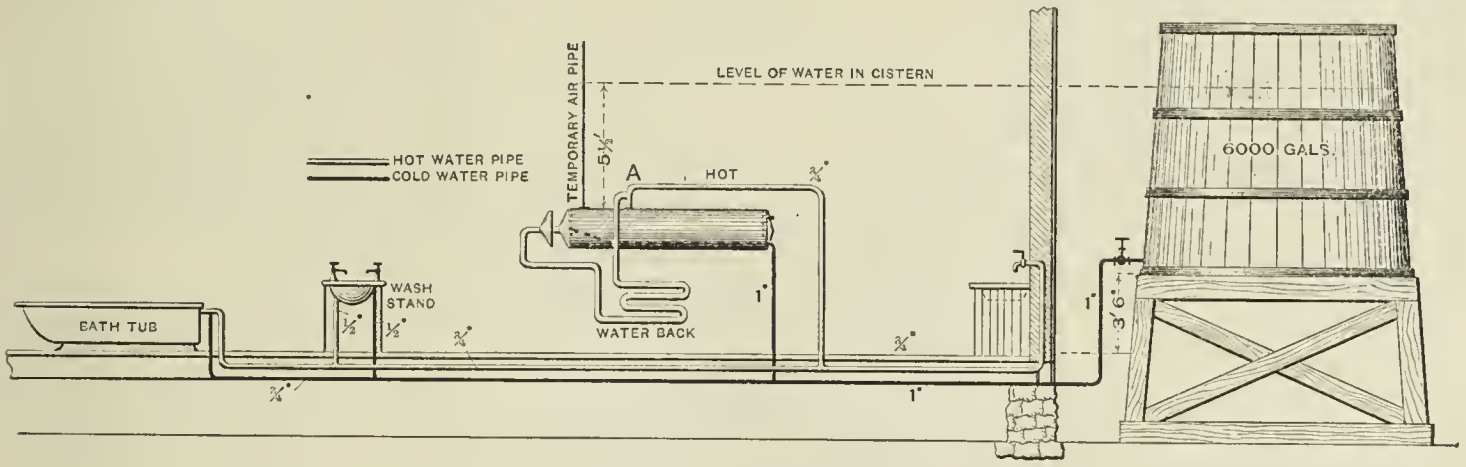
Cement for Marble and Basins.

From H. F. H., *Boone, Iowa.*—In *The Metal Worker* of March 9 "E. S. N." inquires for a cement to fasten bowls to marble slabs. If he will use white lead and sand mixed as stiff as putty, he will find that it will stand all tests. He must be sure to have it stiff and well mixed, or the oil will soak through the slab if it is thin.

From CHICAGO.—I notice in *The Metal Worker* of March 9 an inquiry from "E. S. N.," Westminster, Md., who wishes a recipe for a good cement for joining marble and basins to marble slabs. The basins should be ground to fit the marble and then plaster of paris used as a cement. When properly applied it will not break or fall off.

Japanning Tin.

From J. H. R., *Munhall, Pa.*—For some time I have been unsuccessfully attempting to japan tin. Can *The Metal Worker*, through its columns, explain the proper method to be employed, as manner of applying, temperature for baking, &c. ?



Answer.—The japanning of tin is an operation that requires considerable skill and experience, and if our correspondent has much of this work to do, it might be well to employ a regular japanner. For japanning by the means of heat, it is necessary to have a closed closet or oven, which is to be provided with a small stove or other heating device by means of which an even degree of temperature can be maintained for any desired time. The oven should be provided with a suitable door, and can be made of brick or galvanized iron, the walls being double, similar to the portable bake ovens. Provision should also be made for a steady draft of air through the oven for the purpose of removing the vapor from the drying japan. The oven should be kept free from dust or smoke, and be provided with proper shelves and hooks, so arranged as to be adapted to holding the various articles that are to be baked. Ovens of this sort are manufactured by the G. S. Blodgett Company, Burlington, Vt.

The japan is applied to the article by means of a flat varnish brush, and when applying the japan the strokes should have such a direction as to insure their being horizontal when the article is placed in the oven, thus preventing the formation of streaks. After the articles are covered with japan they are to be placed in the oven, which can be at a temperature of about 125° F., and gradually raised to 300°. As soft solder becomes weakened at 320°, soldered articles should not be heated over 300°. The articles are to be kept in the oven for five or six hours or longer, when the temperature of the oven is gradually reduced. Baking japans of various qualities and colors can be obtained from varnish manufacturers, as can also drying japans, that do not require to be baked. If it is not convenient to use an oven for baking a lacquer for tin can be made by reducing No. 1 furniture varnish with turpentine and coloring with

any of the transparent colors. A cheap brown japan varnish for tin can be made by reducing asphaltum varnish with turpentine, or rather by putting a little asphaltum varnish into turpentine, for so little of the varnish is required that it is liable to be made too thick, and thus give the tin the appearance of being painted. A thin varnish brush should be used for applying the liquid, and by experimenting on pieces of tin the required shade can be obtained. When the article to be covered with either thick or thin asphaltum is warmed, the varnish will dry quickly, and be quite hard and glossy.

Air Bound Service.

From E. M. P., *Brookhaven, Miss.*—I send a sketch of a range boiler and connections which I have recently put up and which does not work. I would be glad to receive some information as to the cause of the trouble; first, to stop the owner from visiting my shop three or four times a day and worrying me, and then, too, for my own satisfaction and enlightenment. The cistern is a large one, 10 feet high and 11 feet in diameter at the base, and holds 6000 or 7000 gallons. It has 4 feet of water in it, and the top of the water is 5½ feet above the boiler. The boiler is a patent self cleaning one holding 50 gallons. It has two openings in the side, two in the top and one in the bottom. I first set it upright on the floor and without the stand and connected it in the usual way, but it would not fill up. I concluded that there was not enough pressure from the cistern, as the water was only about a foot above the top of it, and then I connected it horizontally, as shown. I used the side opening near the center for the hot water return from the water back, and connected it direct with the pipe leading to the bathroom and kitchen sink. The boiler lies on a level with the water back. The hot water pipe between the stove and the boiler has three elbows in it, and the cold water pipe has only two turns in it. The openings in the boiler are all 1 inch, which I have reduced to ¾ inch. I use only one opening in the top end of boiler; the other I plugged. The cold water supply pipe is 1 inch until it enters the boiler, when it is reduced to ¾ inch. I have one main pipe under the house taking the cold water to bathroom and sinks from which I take the cold water supply for the boiler. Now, then, the trouble comes. The work is all done, and the cook is mad because I have turned the kitchen stove upside down, and the "man of the house" wants hot water to bathe. The trouble is this: There is plenty of hot water in the boiler, and the pipes under the house are full and hot, but it will not run out of the faucets. I forgot to say that my pipes all run down and under the floor and then up to the sinks and bathtub. There seems to be pressure everywhere except at the faucets. The cold water flows finely, but the hot seems to stop in the pipes just where they turn up through the floor to the faucets. Now I find that by opening up a union in the hot water pipe under the house there is plenty of pressure and boiling hot water. Thinking that the whole system needed air, I attached a piece of pipe temporarily to the unused opening on top of the boiler; but that did no good. I found, too, that when I gave the pipe air by unscrewing the union under the house the water ran some from the lowest faucet in the bathroom; but when the union was made tight again the flow of water stopped. The water is heated quickly and circulates well. There seems to be a lack of pressure somewhere. Please tell me where the trouble lies. I hope my description, explanation and drawing will enable you to see the cause of the trouble. Is it a lack of force from the cistern, or is it a want of air in the pipes? Is my construction of hot water pipe from coil to boiler right? Please let me hear from you through *The Metal Worker*.

Air Bound Service.

Answer.—The trouble is due to air collecting in the hot water pipe from the boiler where it turns down to supply the fixtures. If an automatic air valve is placed on this pipe at A or a pipe open at the top like that placed on the boiler, but run up high enough so that it will never overflow, the air can escape and the water will flow. If a pipe is used for an air vent, the end may be turned down after it has run up above the highest probable water level and the end carried to a sink so that an overflow could do no harm. A dip such as is shown is common in piping house service and only gives trouble when the water pressure is extremely low, as in this case, where, the head being about 5 feet, the pressure is but slightly over 2 pounds. All water contains more or less air, and in boiling the air is liberated to collect at some point unless it can escape. In this case it has collected in the service pipe and when heated it expands and the pressure is not sufficient to displace it. In drawing water from a hot water faucet the discharge often commences with an irregular stream interspersed with air puffs, when finally the water flows smoothly. This is because there is sufficient pressure to drive the air out ahead of or along with the first flow of water. On opening the union in the cellar a siphonic action was started which caused the flow of water. Water flows from the cold service because there are no air traps in it. The arrangement of the piping has no special defects, but for a 50-gallon boiler 1-inch pipes to and from the water back are better than ¾-inch pipes. It is better for the bottom or lowest part of any boiler to be higher than the highest part of the water back, even though many boilers are set differently.

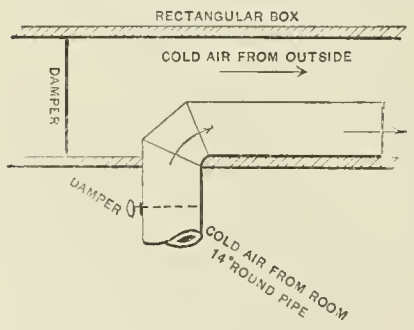
Pattern for Conveyer.

From J. S. K., *St. Louis*—I would like to learn through *The Metal Worker* how to cut the pattern for the flange of a conveyer. I have a job at hand that requires a flange around an 8-inch pipe, the flange to be wide enough to fit tight into a 16-inch cylinder and must make a circuit every 30 inches, as shown in the sketch.

Note. This is a problem that has frequently been presented to us, but has never been answered in the way requested. As a matter of fact a pattern cannot be cut for the helix described by our correspondent. To make the form the metal has to be stretched. The usual way, we believe, is to cut the metal into split disks and then hammer them until they will take the proper pitch. Then by fastening a succession of disks together the conveyer is formed.

Stained Galvanized Iron.

From SUBSCRIBER, *New York*—Can some reader of *The Metal Worker* give the formula for restoring galvanized sheet iron from store or mildew defects?



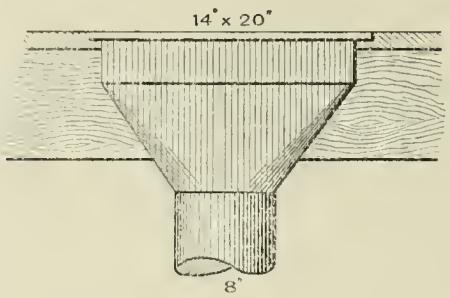
Note.—Galvanized iron is often discolored from dampness, and the appearance very closely resembles mildew, although, of course, it cannot properly be called mildew, which is a vegetable

growth. We think it is the custom in most shops to scour the discolored iron with a wire brush or something that would produce the same effect, and then use the iron in places where the discoloration is not objectionable owing to appearance. To restore the original appearance of the iron is impossible unless the sheets are regalvanized.

A Peculiar Furnace Experience.

From CHARLES N. ARNOLD, *Norwalk, Conn.*—If "C. S.," Cleveland, Ohio, who reports a peculiar furnace experience in *The Metal Worker* of March 9, will connect the exhaust pipe from the sitting room with the furnace pit, just under the edge of the bottom plate of the furnace, instead of running it into the furnace casing or chamber, it probably will work all right, provided that the slide in the cold air box is closed sufficiently far that the heater is compelled to receive a portion of its supply of cold air from that particular source rather than from the cold air box proper. Exhaust pipes of this description are often very erratic in operation, and not infrequently disappointing in results. In my judgment, the difficulty is largely a question of too great a supply of cold air for the number and size of hot air pipes in commission, which transforms this exhaust pipe into a service or hot air pipe. Neither of the methods proposed provides the best method of disposing of the cold air in the room. If "C. S." will send me his address I will endeavor to inform him how to construct a cold air relief or exhaust pipe that will properly ventilate the room.

From J. W. G., *Clinton, Ill.*—Referring to the communication from "C. S.," Cleveland, Ohio, in *The Metal Worker* March 9, I would suggest the following methods of meeting the difficulty. I have never met exactly this trouble in practice, but have had something similar. The cold air duct is of course made large enough to meet all the possible demands likely to be made upon it at any time. When only three



A Peculiar Furnace Experience.

or five pipes are used, as mentioned, the duct is of course larger than these pipes require. The cold air pipe should have a damper for use at such times, but we are not advised of any, nor do the sketches show one. It is likely that this was the condition when the inside cold air duct was added on the side of the furnace opposite the outside cold air duct. This latter having larger capacity than the hot air pipes in use would produce a slight pressure on windy days, which would be relieved by heated air coming from the register in question. I think a damper as mentioned above and properly set would prevent this trouble. I would also take the editor's suggestion and remove the length of pipe inside the furnace.

If the firm having this in charge do not care for expense I would recommend that they run pipe from the register in question direct to the nearest point of the outside duct and place an elbow and length of pipe just inside, the length of pipe pointing toward the furnace. Dampers should be placed in conspicuous places in both ducts. I think no difficulty would ever be found with this arrangement.

From S. J. P., *Pittsburgh.*—In answer to "C. S.," Cleveland, Ohio, on a peculiar furnace experience, in *The Metal Worker*, March 9, I would suggest that he reduce the exhaust pipe

A Peculiar Furnace Experience.

from 14-inch to about 8-inch, making his register box funnel shape or tapering from 14 x 20, which is the size of exhaust register, down to 8-inch or not over 9-inch, and then carry a pipe to the extreme bottom of heater, having an elbow turn up. Then put a damper in main cold air duct, if it hasn't one already; close the damper in main cold air duct until he finds the upward current drawing down the extra exhaust pipe and he will find it will work all right. The first mistake is the exhaust pipe is too large and the main cold air duct brings all the cold air the heater can take care of, consequently it won't draw on the extra one.

From EXPERIENCE, *New York.*—I had just such a peculiar furnace experience as that mentioned in *The Metal Worker* of March 9 some years ago. The room was exposed to the north and east. I ran the hot air pipe up to within 8 inches of the ceiling, and carried the cold air pipe from the floor to the furnace. Then everything worked like a charm. "C. S." can test this method easily by taking out the register and running a pipe that will fit tightly into the collar of the register box up near the ceiling. Then by having a good fire and the doors leading from the room closed, a few minutes will show him how he must vary the piping to suit the rooms to get the results he desires. There may be other circumstances connected with his case that hinder circulation, but ordinarily the method I have described will overcome the trouble. Furnace problems are very simple, consequently very elusive. If the cold air and hot air pipes are properly proportioned with the size of the furnace, air will flow in almost any direction. Madam Nature wants her laws obeyed and she can be coaxed to do most any thing, but always makes trouble when forced. She has always been very kind to me, and will be to any one who tries to please her.

Trouble With a Water Tank

From C. A. W., *Weissenburg, Pa* — About 18 months ago I was called upon to line a water tank which was used instead of a cistern. The tank was 7 feet long, 4 feet wide and 6 feet deep, and I used in it No. 26 galvanized iron. The tank itself is made of 2-inch planks thoroughly braced so it cannot expand. I considered it well made of wood, and put in the iron and soldered the seams as thoroughly as I could. The owner, however, soon reported that the tank was leaking, and when I came to find out the trouble I discovered that about one half of the side seams were cracked. I repaired it, but again it leaks. I find the bottom is all right. I would like to hear from readers of *The Metal Worker* if they have had similar experiences and how they overcame the trouble.

Finish for Slate Roofing on Ridge and Hip.

From SLATER, 772 *Columbia street, Hudson, N. Y.*—Replying to the inquiry of "M. A.," Suffolk, Va., that appeared in *The Metal Worker* of March 16, and noticing the explanation you have given him, would say that I think he will be obliged to look for an experienced, practical slater to teach him the trick of the trade; and if I can be of any service to him, I should like to have him write me. I would like to hear from "J. R. S.," West Fairview, Pa., who wants to know the best method of hanging gutters for slate roofs on high buildings without the use of ladders. The inquiry appeared in *The Metal Worker* of November 24, 1894.

Which Is Best for Furnace Tops?

From FOREMAN, *Newark, N. J.*—In answer to "J. C." in *The Metal Worker* March 2, in reference to the style of furnace top, my experience has been in favor of the cone top. Either style of top will not hinder the furnace from doing good work if there is an ample air chamber under it. If the radiator in the furnace reaches up into the top, leaving no space for a volume of air to collect, the hot air pipes are not likely to be well filled. I have known unsatisfactory furnaces made to do good work with no other change than an increase in the hight of the air chamber. If the radiator fills the furnace body or casing full, the air that passes up between may not be enough to fill the pipes, while if there was an air chamber for the inflowing air to cushion against, it would flow in faster and would expand to fill the air chamber, and then the pipes would be full. For instance, a 36 inch casing inclosing a radiator 30 inches in diameter would leave 3 inches of air space all around. The 36-inch casing would have an area of 1017 inches. The radiator would have an area of 706 inches, leaving an area in the 3 inch air space of 311 square inches. Now if the furnace was put up in a house with three 9 and four 8 inch pipes, with a cold air duct 12 x 24 inches, there would be trouble without an air chamber. The area of the pipes would be 389 inches, or 78 inches more than the air space, so that some of the pipes would surely feel the effect. The area of the cold air duct would be 288 inches, or almost equal to the air space before the air is expanded by being heated. It is generally conceded that the air would, in ordinary cold weather, expand one-third, when, if there was no

air chamber at the top to receive this increased bulk due to expansion, the air would be held in check and overheated. Then, when delivered to the pipes at a high temperature, it would cool and contract in the pipes, and there being no air chamber to supply the deficiency, some annoying behavior would follow. By all means have an air chamber at the top of the furnace whichever style of top is used, and the average furnaceman will find it advisable to use the cone top in low cellars, to get the air chamber and pitch for his pipes. He will be forced to use the flat top when a number of pipes run in one direction, and he will find that, used with judgment, both styles of tops will do good work if an ample air chamber is provided. With steel furnaces having solid domes not less than 12 inches should be used on a 36-inch furnace, and increased as the diameter of the furnace and the area of the pipe increase. Furnaces having a cast iron radiator of hollow circular style, supported by pipes which bring the gases to it, may work with less air chamber.

Water Hammer in Pipes.

From G. D. H., *New York*.—Answer to inquiries of "G. A. L.," Manchester, Vt., and "G. J. M.," Oshkosh, Wis., that appeared in the *Metal Worker* March 16. The sudden closing of fire hydrant will give a shock to every house water supply for many blocks around unless their water supply pipe systems are amply provided with air chambers. The intensity of the shock, or more properly the water hammer, depends upon the length and size of the main line of the water flow between the hydrant and the reservoir, the velocity of the water in the main being the measure of the intensity of the shock at the sudden closing of a hydrant, hence much greater trouble from this cause occurs in town water systems with small sized mains. Thus under the varying conditions of the spouting, volume, and the time of closing the valve of the hydrant, there are possibilities of any percussion pressure up to 400 or more pounds per square inch being brought to bear upon the main near the closing hydrant and the house pipes and hot water boilers in the neighborhood. The only safety in a water supply system is in using care and common sense in the handling of hydrants, and, in dwellings, to provide air chambers by extending the pipes a foot or more above each bibb in the house or as many as can be made convenient. As in "G. J. M's." trouble, if the plumbing construction does not allow of continuing the pipe for each sink or wash basin there should be an extension of both hot and cold water pipe at the bathtub and also at the kitchen sink. If the water is used above the kitchen, second or third floor, a branch pipe may be taken out of the water pipe near the floor and carried up under the sink for an air pipe on each story. Where the water is continually under pressure at the bibbs, the air finally becomes absorbed by the water, which will be known by the hammering in the pipes when bibbs are quickly closed. In order to recharge the air chambers, the water should be shut off in the cellar and the water in the pipes drawn off at the lowest bibb with the other bibbs open, when air will be drawn into the pipes and the air chambers will become charged with air. An air chamber in the cellar will only half remedy the water ram, as it will stop the impact on the street service pipe, but will not prevent it at the bibb that is closed suddenly. There is no necessity for making the air chamber other than with the pipe used for the house plumbing. Wherever a bibb is fastened on to a lead pipe the pipe can be continued up the wall or backboard for a foot or more as convenient. Ball cocks sometime stick. They should be left easy on the plug and the float be loaded to half immersion when free in the water; they will then pull down easy, or what is perhaps better use the compression valve and ball which is now almost universally used in our cities for flush tanks.

Method of Heating Water.

From E. M., *Omaha, Neb.*—In order that the great West shall be represented in the Letter Box, I will attempt to give "J. P.," Massachusetts, assistance with his water heating problem in *The Metal Worker* of February 16. Having set his boiler, the bottom of which should be above the heating coil for good circulation, it should be connected with the coil in the fire chamber of the steam heater, with a rise in the pipe from the top of the coil to the side connection in the boiler, and a fall in the pipe from the bottom of the boiler to the bottom of the coil. The coil has sufficient heating surface for a good size boiler, unless a great deal of hot water is drawn. The coil will expose about 14 square feet of heating surface, and having no data as to the capacity of such surface for heating water in a kitchen boiler, I make a deduction from house heating rules. One square foot of surface in a coil, under such circumstances, would carry 40 square feet of radiation, and assuming that there is a pint of water to the square foot, 1 foot in the coil should heat 5 gallons of water, and as the coil has 14 feet of surface, it would probably heat 70 gallons. The house heating rules are based on heating the same water over and over, while in the case of "J. P." cold water would enter the boiler to be heated every time hot water was drawn. However, as the surface exposed by the boiler is so very much less for the water contained in a house heating system, it is probable that the coil would keep even a large boiler filled with hot water. I would risk a 100-gallon boiler in connection with it. In piping from the coil to the boiler, at the proper or most convenient place for connecting with the summer heater a Y should be placed on both the flow and return pipe for receiving the pipes from it. On the flow pipe from both the coil and the heater a gate valve should be placed to shut off whichever is not in use. As the boiler is connected with a supply pipe, no expansion tank will be needed. Owing to the warmer temperature of the supply water and the atmosphere, the work of the summer heater will not be so heavy as that of the coil, and a small heater will do the work. Even though the coil is made of 1¼ inch pipe, as stated, the connecting pipes may be 1¼ inch with some advantage, and the boiler connections should be full size.

Furnace Pipe Rule.

From E. T., *New York*.—If I had the problem which "H. E. G." presents in *The Metal Worker* February 2, I would calculate on a velocity of 400 feet per minute and filling the room in 15 minutes. I would then get the velocity to do the same work in one minute by multiplying the 400 by 15, which would give 6000. I would then divide the known quantity of air by 6000, which would give the area in feet of the opening necessary to let this amount of air through. I would then reduce the area in feet to inches and divide the result by 0.7854 and extract the square root of quotient. This would give the diameter of a pipe that would let the known quantity of air enter in 15 minutes at a velocity of 400 feet per minute. I would use a register with dimensions that would give an area 50 per cent. greater than the area of the pipe, as register faces are made much more solid or close than formerly.

Is It a Good Investment?

From T. W. R., *San Francisco*.—We reply to "J. B," New Jersey, in *The Metal Worker* of February 23. It may be a little late, but you will remember that we do not receive *The Metal Worker* until Saturday, it then being about a week old, but we thought our experience in regard to his inquiry might be of some use to him and also to others. We cannot agree with him in the economy of a circulating pipe being a good investment in connection with an ordinary cook stove for a heater. The great objection to a circulating pipe in an ordinary residence is that the constant traveling of the water through the pipe cools off the water, as the proportionate body of water carried in a ¾-inch pipe to the boiler is many times greater, consequently making it difficult to raise the temperature to the ordinary requirements for domestic use. I have seen new residences where the silver tongued plumber talked the owners into putting in a circulating pipe, there not being over 200 feet of hot water pipe, where the kitchen range could not raise the water above 110°, and by shutting off the circulating pipe it could raise the water to 160°. This is actual experience. Circulating pipes do not give satisfaction where the ordinary kitchen range is used as a heater. In large buildings, where large quantities of water are used and where a special heater or steam is used, then it is a paying investment. This experience is in California, and if it is not a success in our mild climate, it surely could not be where you have below zero weather.

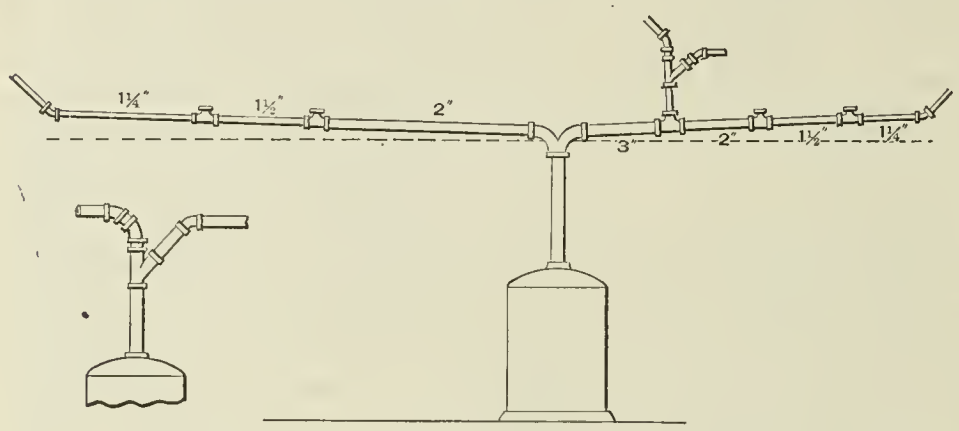
Are Gravel Roofs Durable?

From W. F. COZZENS, *St. Louis*.—My attention has been called to an article in *The Metal Worker* of March 2, from G. F. Wheelock, Birmingham, Ala. His position in respect to the cost of a tin roof is well taken. I think, however, I can break the club to which he alludes as being in the hands of the gravel roofer. If he ever visits St. Louis—and Southerners do sometimes come here—I shall take pleasure in showing him tin roofs 36 years old, and one that I worked on 54 years ago, and which has not had more than one coat of paint in 20 years.

Keeping Shop Tools.

From ZENOPHEN.—I wish some of the contributors to the Letter Box would describe the best method of keeping shop tools. I will start the question ball rolling by asking for a good way to keep shop soldering coppers.

Pattern Wanted.



From C. R., *Baltimore, Md.*—Please ask some of the readers of *The Metal Worker* to submit a pattern for an 8-inch flaring collar to use in a square pipe. I think one of your former writers signing himself "Practical" described such a pattern.

STEAM AND HOT WATER.

A Pipe Fitting Question.

From SAMUEL HEINS, *Rondout, N. Y.*—Having snswered many questions of *The Metal Worker* on different subjects, and wishing to help my fellow workmen in ferreting out the defects on different kind of work, I read over *The Metal Worker* of February 9 and saw a pipe fitting question from "C. E." of Worcester, N. Y. With the experience I have had I think he makes a big mistake at the starting point on the boiler. I never approved of using a T when there are fittings made that would render better service. By using a twin ell or a Y with a nipple and a 45° ell he would get better results, as I will show further on. There is less friction with them and there would be a better circulation. There should never be any "bull nose" fittings used on hot water work. Each one of such fittings, especially elbows, is an obstruction. I would also recommend never to take any connections from the side of a fitting. They should be taken from the top with a short nipple and a 45° ell. As far as I understand it he would not get a good circulation. I would say that *The Metal Worker* is right as it explains the case. Let me say to "C. E." that the best way would be for him to experiment and find out himself which would be the best way. That is the way I would do. The way the best mechanics find out all the defects is by experiment. As the old saying is, "If at first you don't succeed, try, try again." I have had many difficulties in my past experience, and I started with steam and hot water heating when there were only about half a dozen men in the United States who did such work. I worked for Jas. P. Wood when he was the only man in Philadelphia who did steam heating, and we had to work hard, and it took a great deal of thinking to make a job work perfectly. Now every Tom, Dick and Harry that never served a day at the business comes out as a steam and hot water fitter. I remember one man in Riverton, N. J., who never saw a hot water valve or a hot water job done, and he did not know the minimum supply of different size pipes, but came out as a hot water and steam engineer. "C. E." starts off with a 3-inch pipe from boiler, which is the minimum flow that would be used for 500 to 800 square feet of direct radiation, which is large enough to supply a very good size job. I show in the sketch the way I would start. I never use any elbows if I can avoid them. The connection is made with a twin elbow. Another way of making the connection is with a Y and two nipples and two 45° ells.

By this method an essy flow will be started. A part of the labor on any job is making a plan of the proposed work, which should always be done. As I understand the branch on the main, it is intended that a T shall be placed on the riser in the same way as at the boiler. If I was doing the job I would put in a Y and with 45° ells make the turns as shown. This would make a first-class job and a free circulation, but my advice to "C. E." would be to study up on steam and hot water heating.

A Pipe Fitting Question.

Loss of Heat and Radiation.

From FRANK J. GRODAVENT, *Denver, Col.*—I have taken some interest in the questions of "H. T. G." on the loss of heat and radiation, as published in the issue of *The Metal Worker* for February 9, 1895, page 45. I have looked up the back issues of *The Metal Worker* for 1892 containing the articles of Leicester Allen on this subject, and to which you refer. In the issue of October 1, 1892, psge 38, in which illustrations of different constructions of walls are given, and practical example taken of Fig. 21 to show the application of the different rules given, there are a few points of doubt to me about which I desire to question. I have been over the several articles published by Mr. Allen, and they contain some most valuable ideas, and lead direct to the subject, and it is their many good points which make me the more desirable to clear the cloud of doubt. In going through the articles I found a number of errors regarding reference letters and decimals, but these I have corrected. The practical example is the one upon which I desire information, and relates to Fig. 21. First, regarding the second coefficient of transmission being 0.4411. Is this amount correct? Conduction for lath and plastering 1 inch thick being 3.86 units of heat per square foot per hour, for ⅞ inch (being less than 1 inch) would naturally lose more heat units than if 1 inch thick. Seven eighths inch equals 0.875 inch; 3.86 divided by 0.875 equals 4 411 as the units of heat lost through 1 square foot of lath and plaster in one hour. It therefore seems to me that 4 411 should represent the second coefficient of transmission, instead of 0.4411 as published. The third coefficient of transmission as published is 1.2100, and I cannot see why 1.2100 should be called the second coefficient of transmission, and used in the first part of "operation second"—viz., "1.1558 divided by 1.2100 equals 0.3931." First coefficient as published is 1.1558, and the second coefficient as published is 0.4411. If this 0.4411 is correct instead of 4.411, as I have questioned, why do we not divide 1.1558 by 0.4411, instead of by 1.2100, which is published as the third coefficient of transmission, and to which reference as the third coefficient of transmission is made in the fourth column, page 38, issue of October 1, 1892? These articles of Mr. Allen's are very useful, but with a hitch like this in his plain way of explanation leaves a doubt in the final result not satisfactory. Possibly there are others who are in doubt on the same matter. If it can be made more clear I for one will be glad to receive an explanation that I may further investigate this most interesting subject.

Answer.—The above letter was submitted to Mr. Allen, and he furnishes the following reply:

I offer your correspondent my hearty thanks for his criticism of the figures given in the example of the application of Rule I in my article on the above subject in *The Metal Worker*, October 1, 1892. The whole of that arithmetical computation was performed by a trusted assistant, as explained near the top of the fourth column on the same page. I was too busy at the time the article was printed to give it the attention it demanded. I did not see the proofs before printing, and having looked at the series only in the most cursory way since it was published, I had not discovered the errors pointed out. The rules and formulæ, which had been for some years prepared before they were published, are not vitiated by these figures. A writer in the *Popular Science Monthly* has recently said: "We often find that the errors in a conscientiously thought out thesis lead to a more thorough understanding of the subject than would have been attained had all the propositions been demonstrably true." I hope this case will prove no exception to that wise saying, although here it is only a mistake in the application, not the theorem that is questioned. If the

reasoning given at the conclusion of the article, and on which the rules are based, be not challenged (and so far no one has done this to my knowledge), the rules must stand good, and the application can be easily made to any particular case. The errors he points out in the working out of the example are admitted. It simply remains to correct them in order to reach an exact result.

The second coefficient in the computation is vitiated by the displacement of the decimal point and should be 4.411. With this correction we have, first, coefficient = 11.1558; second, 4.411; third, 1.2100; fourth, 1.1558; fifth, 1.1558; sixth, 2.50; and, seventh, 1.1558. In the second operation occurs the erroneous use of the third coefficient instead of the second in obtaining the first quotient. This quotient ought, therefore, to be $\frac{1.1558}{4.441} = 0.2600$, instead of 0.3931, as stated, and the second quotient should be $\frac{1.1588}{1.2100} = 0.9552$, instead of 1.0000. I also notice that in the fraction from which the fifth quotient in the second operation is derived the decimal point is dropped out of the denominator, although the quotient itself, as given after the sign of equality, is printed correctly. The sum of the corrected quotients and the first coefficient (according to the rule) will be 5.8360, which is the correct divisor or denominator of the fraction in the last operation whereby the temperature difference between the surface of the plaster and that of the interior air and objects is expressed. The numerator of that fraction is printed 700, instead of 70°, as it should have been, but the following quotient plainly shows that it was intended to be 70°. Now writing this fraction again, with both numerator and denominator corrected, we have $\frac{70°}{5.8360} = 11.994°$, the interior temperature difference sought, instead of 11.643° as published. The difference is 0.351°. Fortunately, in this case one error corrected another so largely that the final result differs by only a trifle more than ¼° from the true difference. If the difference originally stated has been taken on trust by any one without going over the figures, it cannot, therefore, have misled any one materially. It is because it so closely approached the figure for this difference as recorded in my note book for a wall of the kind for which the calculation was made that I accepted the calculation as correct, and incorporated it into the manuscript of the article published on the date named.

In conclusion, I beg to again thank your correspondent not only for his discovery and criticism of these errors, but also for the courteous style of his criticism and the compliment he is pleased to bestow upon my humble effort to reach exact methods in a field where guesswork is much too common.

Heating Power of Petroleum and Gas Stoves.

Some very interesting information is contained in the following paper by Thos. Fletcher, the well-known gas engineer, which we reprint from an English exchange:

The data from which the following comparisons are made are too long and technical for the general reader, but those who wish to study the subject thoroughly and verify the results, will find the matter dealt with by Deville (*Comptes Rendus*) and Box ("Treatise on Heat"). The heating power of ordinary coal gas has been repeatedly verified, and the standard universally accepted is what is known as the British thermal unit—*i.e.*, the amount of heat necessary to raise the temperature of 1 pound of water 1° F. One cubic foot of ordinary London gas has heating power equal to 660 of these units—*i e.*, if all the heat evolved in burning is perfectly utilized, 1 cubic foot of gas will heat 660 pounds of water, equal to 66 (Imperial) gallons, 1° F., or 6⅔ gallons 10° F. The heating power of an average sample of ordinary petroleum is 161.920 units per gallon, and if all the heat is perfectly utilized without waste, 1 gallon of petroleum will have the same heating power as 245 cubic feet of gas. If we take the price of gas at 2 shillings and 6 pence (62 cents) per 1000 cubic feet, the value of petroleum as a fuel should be 7½ pence (15 cents) per gallon, as compared with gas under the same conditions.

When these fuels are used in flueless stoves of any kind and the combustion is perfect the whole of the theoretical heating power given above can be and is obtained in ordinary use in heating the air. Either 245 cubic feet of gas or 1 gallon of petroleum will in a flueless stove raise the temperature of 603,000 cubic feet of air 20° F. The figures appear large, but the amount of heat required to raise the temperature of air is so exceedingly small that the figures become almost beyond the power of imagination. It will make matters more clear to deal with smaller quantities. One ounce of petroleum and 2 cubic feet of gas have precisely the same heating power, and either if perfectly burnt in a flueless stove will heat a quantity of air equal to that contained in a room 23 feet square and 10 feet high 20° F. Of course, nothing approaching this is obtained in practice for two very sufficient reasons: The walls, windows and ceiling absorb the heat rapidly, and the air in an ordinary room is on an average changed every 20 minutes by natural ventilation. Even when the walls, &c, are heated to the same temperature as the air it has been found by repeated trials that in a room this size the loss by conduction of the heat through walls, &c., is equal to that given off by the combustion of 15 cubic feet of gas per hour, and this added to the loss by ventilation makes a total of 21 cubic feet of gas, or 10½ ounces of petroleum per hour, to retain a rise of 20° F. where the room is continuously heated day and night. Of course, when the heat is only intermittent more will be required until the temperature of the walls corresponds with that of the air. and the raising of the temperature of these is a very slow process.

When we come to the heating of water or solid objects conditions are greatly changed, owing to the great loss of heat which is necessary in ordinary practice. Even with gas, in a perfect atmospheric burner with flame contact under the best conditions, water cannot be boiled in a copper pan without a loss of at least one-third of the heat; and with a petroleum lamp nearly two-thirds are lost owing to the impossibility of flame contact, which would cause smoking. The practical result is that for boiling water, the comparative value of petroleum, as compared with gas at 2 shillings and 6 pence (62 cents) per 1000 cubic feet, will not exceed about 4 pence (8 cents) per gallon.

Circuit Systems of Hot Water.

From PIPER, *Illinois.*—Is it practicable to pipe hot water heaters on the one-pipe system—that is, to use but one main from the boiler and to connect both flow and returns from the radiators with it, instead of running a separate flow and return main? In the one-pipe system, will the radiators that are furthest from the boiler get as warm as those that are nearer and get the water first? Will not the water be colder after passing the first radiator on the run, and so continue to grow colder after passing each successive radiator? Will the one-pipe system give as good results as the two-pipe system?

Note.—Some heating men have found no difficulty in making a hot water circuit system satisfactory. In making connection with the radiators, the flow connection is taken from the top of the circuit main, and the return from the radiator is connected with the side of the main. By this means the colder water from the radiator does not lower the temperature of the water in the top of the main to any considerable extent. In proportioning circuit mains some use the area of 1¼-inch pipe for each 100 feet of radiation, which is a more generous proportion than is usually applied. By this means the main has a considerably larger area than the connections to the radiators, permitting the water which is returned cool from the radiators to flow along the bottom of the main without influencing the hotter water in the upper part. Nevertheless, it has been found that the first radiators on a circuit system become somewhat hotter than those at the latter end. In consequence, some place a greater amount of radiation in the rooms that are fed on the last end of the circuit. Where a circuit system that is properly proportioned has been installed, satisfactory results are obtained. It is claimed by those who have had the most experience with it that it is not adapted for all classes of buildings. Some information on this subject will be found on page 40 of *The Metal Worker* of March 2. We will be glad to have our readers discuss this subject more fully.

G. B. LEONARD has discontinued his business at La Salle and moved to Chicago, where as one of the partners in the firm of Leonard & Weinberg, 4316 Cottage Grove avenue, he has engaged in the heating and plumbing business. He reports the prospects for good trade as excellent, and mentions that they have on hand at present from $3000 to $4000 worth of heating contracts and expect soon to have their shipping and show rooms in good order.

Formula for Hot Water Piping.

BY J. L. BIXBY, JR.

The following original and purely empirical formula for calculating the size of pipes for hot water heating may be of interest to the readers of *The Metal Worker:*

Sq. ft. = square feet of surface.

D = diameter of pipe in inches.

$\sqrt[5]{F}$ = fifth root of the floor, as first, second, &c.

INDIRECT RADIATORS.

$$\text{Sq. ft.} = \frac{100 \times D^2}{3} \qquad D = \sqrt{\frac{3 \times \text{sq. ft.}}{100}}$$

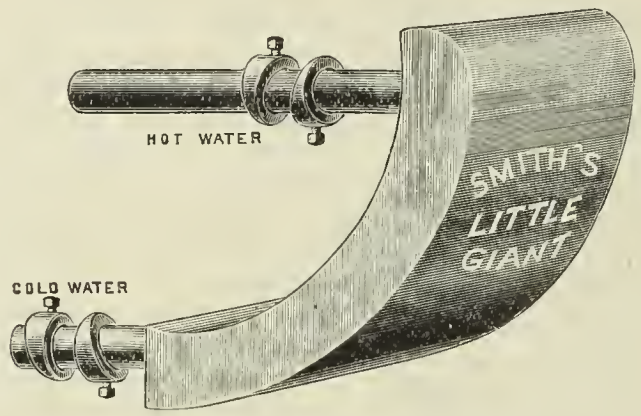
FIRST-FLOOR RADIATORS.

$$\text{Sq. ft.} = \frac{100 \times D^2}{2} \qquad D = \sqrt{\frac{2 \times \text{sq. ft.}}{.00}}$$

RADIATORS FROM RISERS.

$$\text{Sq. ft.} = \frac{100 \times \sqrt[5]{F} \times D^2}{2} \qquad D = \sqrt{\frac{2 \times \text{sq ft.}}{100 \times \sqrt[5]{F}}}$$

The appended table gives the square of the nominal diameter of the pipes in inches and the fifth root of the floors. The allowable variation from the answers given by the formula is the mean between the next larger and smaller size pipe. The allowable distance of the radiators from the boiler equals about one-half of the square feet of surface in the radiators. The heating surface in the main pipes must be included in the radiation.



Nominal diam.	D^2	Floor.	$\sqrt[5]{F}$
½	0.25	1	1
¾	0.5626	2	1.15
1	1	3	1.24
1¼	1.563	4	1.32
1½	2.250	5	1.38
2	4	6	1.43
2½	6.250	7	1.47
3	9	8	1.52
3½	12 25	9	1.55

A NEW CORPORATION at Columbus, Ohio, are the Columbus Steam Boiler & Heater Company. The company have a capital stock of $5000 and are formed for the purpose of repairing and manufacturing steam boilers and heaters, tanks, stacks, water towers and the manufacturing of sheet and rolled iron work, the incorporators being William H. Page, William A. Pope, Dennis J. O'Grady, R. T. Huggard and Thomas O'Hare.

Smith's Little Giant Water Heater.

An illustration is herewith given of an attachment intended for use with any warm air furnace. It is placed in the upper section of the fire chamber opposite the feed door, holes being drilled in the furnace casting for the passage of the flow and return pipes. Being placed in this position, above the fire, its curved shape and broad surface cause it to receive the full benefit of the coal consumed without detracting from the general heating power of the furnace. The flow and return pipes are threaded for connection with pipes running through the house. They are also fitted with washers so shaped as to set snugly against the furnace casing and prevent the escape of gas and smoke. Set screws hold the washers tightly in place.

This water heater is designed for two kinds of service. In the first place, it can be used for combination heating, to warm one or two rooms more than can be heated by the furnace, or which are too remote to be easily reached by warm air flues. In the second place, it is adapted to houses in which cooking is done exclusively with gas or gasoline, as while the furnace is in operation the house is supplied with an abundance of hot water without additional cost. Four sizes are made, which are rated to carry respectively 30, 50, 75 and 100 feet of radiation. The Little Giant is manufactured and sold by Charles Smith, 175 and 177 Lake street, Chicago.

Smith's Little Giant Water Heater.

HEATING NOTES.

STEWART A. JELLETT, Philadelphia, president of the American Society of Heating and Ventilating Engineers, had a visit from Vice-President W. M. Mackay of New York this week.

THE KALAMAZOO RADIATOR COMPANY of Kalamazoo, Mich., have opened a salesroom for their radiators at 96 Lake street, Chicago, which will be in charge of Clarence M. Converse.

WE ARE REQUESTED by the Gurney Heater Mfg. Company, Boston, Mass., to state that they have no agency in New York City and that their goods are for sale to any of the trade who might apply for prices.

THE SMITH & WINCHESTER COMPANY, Boston, Mass., send out on the back of an advertising card an acrostic furnished by J. M. Knox of Chicopee, Mass. The verses, in which the initial letters spell "The Winchester Boiler The Best," relate to this well-known apparatus and tells in rhythmical fashion what a great boiler it is.

PRESIDENT JOSEPH BOND of the American Radiator Company had the honor of taking luncheon with the Lord Mayor of London, at the Mansion House in that city on February 28, and also had the pleasure of meeting the Lady Mayoress and family, several members of Parliament, generals and other dignitaries.

J. EDGAR TITZELL, Millerstown, Pa, has added steam and hot water heating to his business and will be glad to receive catalogues and other printed matter from the trade.

W. B GRAVES, foreman of the steam and hot water department of the E. W. Oliver Company, Niagara Falls, N. Y., has tendered his resignation. Mr. Graves has purchased a one-half interest in the establishment of his brother, C. H. Graves of 62 North Clark street, Chicago, who is in the steam heating business.

IN AN ADDRESS before the Stationary Engineers' Association No. 2 of Cincinnati on Wednesday evening, March 13, delivered by Capt. W. H. Meredith, an old marine engineer, the speaker said that in a long experience he had found that the practice of heating and ventilating required more actual ability to carry it through successfully than any branch of engineering he knew of. The speaker went on to show the parallelism between the steam heating plant and the human body. "Let the boiler," he said, "represent the stomach receiving the fuel. Here combustion takes place and starts the vapor on its course through all the ramifications, finally entering the radiator, and there giving up its heat and being condensed into water, it again returns to the boiler through the return pipe, there to receive more heat and start on its circuit again The steam pipes represent the arterial system and the return pipes the venous system of the human body, and the blood flows through the lungs, taking up fresh oxygen and passes on, giving strength, tone and tissue to the body. So also the vaporized water of the heating apparatus gives warmth, comfort and life to those who use it."

THE AMERICAN RADIATOR COMPANY will establish their London office at 143 Queen Victoria street and expect to occupy it by April 1. A commodious storeroom in connection will give ample space for the display of samples of all kinds of heating apparatus and specialties of American manufacture. The location is a most convenient and desirable one, and the company desire that those of the trade who visit across the water should be sure to make that office their headquarters.

The State Department at Washington is about completing a work which will be of great utility to manufacturers and others who are connected with the Central and South American trade. It is a compilation which has been in course of preparation for some time, under a provision adopted by the International American Conference some time since. The work in question is an "International Catalogue of Exports and Imports," containing a uniform nomenclature of articles of merchandise such as are common in the trade between the United States and the Latin-American countries. The terms will be published in English, Spanish and Portuguese,

and the publication will probably be sold to business houses at the cost of printing.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until April 4, for work, including the plumbing, for the United States Court House and Post Office, New Albany, Ind. Drawings and specifications may be obtained from the custodian at New Albany.

THE BOARD OF EDUCATION of Erie, Pa., are to readvertise for bids for heating and ventilating schools 4 and 14.

W. F. RUTTER & Co., Lawrence, Mass., bid $1841 and secured the plumbing contract which requires McShane water closets for the John Tarbox School.

THE H. R. BARKER COMPANY, Lowell, Mass., have the contract for the piping and plumbing in the Shattuck Street Universalist Church.

THE CONTRACT for repairing the steam pipes in the Federal Building, Rochester, N. Y., the estimated cost of which is $900, has been let to Roeser & Co.

A SEPARATE building for housing a system of water closets is to be erected in connection with one of the school buildings at Utica, N. Y.

GEO. B. MARTIN, New Haven, Conn., is building a fine residence in which specially fine plumbing will be required from the successful bidder for the contract.

THE FOSKETT & BISHOP COMPANY, New Haven, Conn., have the contract for the heating and plumbing in a new residence for H. C. Warren.

W. A. T. SMITH, agent for the Kelsey Heat Generator in New Haven, Conn., has recently placed heaters for A. E. Blakeslee, A. J. Carmichael, E. F. Wilson and S. A. Hopkins. Mr. Smith calls attention to the fact that by the peculiar construction of the Kelsey it is adapted for heating rooms in large houses, however remote from the heater. The hot air chambers are built in sections and by this means the hot air from any number of these sections may be directed to any particular room. It is claimed for the Kelsey that it has a large radiating surface and gives a great heat for the amount of coal burned.

SEALED PROPOSALS, addressed to Geo. W. Kerker, Davenport, Iowa., chairman of City Hall Committee, will be received at the office of the Board of Public Works until 2 p.m. Wednesday, March 27, 1895, for all labor and material required for the steam heating, plumbing, gas fitting, electric wiring, and for a complete electric passenger elevator, with all necessary machinery and fixtures, for the new City Hall, in accordance with the plans and specifications now on file in the office of J. W. Ross, architect of said building.

SHEAHAN & GROARK, New Haven, Conn., are doing the plumbing and furnace heating of C. M. Fisher's new house; they are putting two hot air furnaces in Dr. Cremin's house, two in L. P. Sperry's house, and they are doing the plumbing and steam heating in James F. Molloy & Co.'s new factory. They are also thoroughly overhauling the steam heating of the Winchester Avenue Railroad car houses in West Haven and have put in between 2 and 3 miles of piping in the Fair Haven and Westville car houses.

GEORGE F. HAUSLEIN, 80 Fullerton avenue, Chicago, has the contract for plumbing and drainage in the residence of Louis Reemer, 1434 Marshfield avenue.

NELSON & CEDERHOLM, 87 West Ohio street, Chicago, have the contract for the plumbing and drainage in the flat building of J. Gustafson, 183 Richmond street.

WILLIAM READ, 345 Forty-third street, Chicago, is to do the plumbing and drainage in the 15 residences and cottages being built by W. Frenk on Blue Island avenue, Leavett street, Hoyne avenue and Oakley avenue.

FRANK FALK, 729 Milwaukee avenue, Chicago, is to do the plumbing and drainage in the residence of J. P. Rusthoe, Mead street and Milwaukee avenue.

JOHN K. MORAN, 4139 Wentworth avenue, Chicago, has the contract for the plumbing and drainage in the flat building of G. Krahn, 1015 Fifty-first court.

JAMES J. DOYLE, 6040 South Halsted street, Chicago, has the contract for the plumbing and drainage in the flat building of B. F. Jones, Sixtieth and Aberdeen streets.

THE GEORGE ALIES ESTATE, 463 Division street, Chicago, has the contract for the plumbing and drainage in the store and flat building of Adolph Kruse, 2241 North Ashland avenue.

ERNST GARNER, 1740 Milwaukee avenue, Chicago, has the contract for the plumbing and drainage in the residence of E. Melins, 790 Wallace street.

JACOB E. HEDMAN, 656 West Division street, Chicago, is to do the plumbing and drainage in the flat building of William Ballman, 838 West Ohio street.

HARVEY & MOSE, 665 West North avenue, Chicago, are to do the plumbing and drainage in the flat building of B. Larson, 213 Evergreen avenue.

BYRNE & RYAN, 254 Forty-third street, Chicago, are to do the plumbing and drainage in the flat building of T. J. Davis, Sixty-fourth street and Evans avenue.

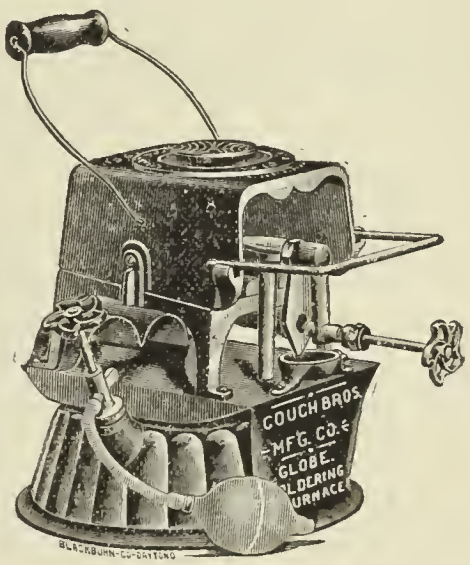
DORE & SON, 1042 West Van Buren street, Chicago, have the contract for the plumbing and drainage in the flat building of W. Farson, Birch and Kendell streets.

CHARLES C. BREYER, 187 West Division street, Chicago, has the contracts for the plumbing and sewerage in the flat building of J. H. Dittmer, 483 Potomac avenue, and in the store and flat building of J. Palenske, 802 North Hoyne avenue.

JOHN C. HICKEY, 551 South Ashland avenue, Chicago, has the contract for the plumbing and drainage in the flat building of C. Kastler, 117 Edgemont avenue.

ROBERT C. MILLER, 897 West North avenue, Chicago, is to do the plumbing and drainage in the store and flat building of A. W. Wolff, 1485 same street.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until April 19 for a low pressure return circulation steam heating and ventilating apparatus for the United States Post Office Building at Lima, Ohio. Drawings and specifications may be obtained from the office of the Supervising Architect, Washington, or from the superintendent at Lima.



KEEFE & WARNOCK, 1105 Lincoln avenue, Chicago, is to do the plumbing and drainage in the nine cottages of L. P. Hammond, Gidding, and Lawrence avenues.

MORRIS BROS., 3442 South Halsted street, Chicago, are to do the plumbing and drainage in the store and flat building of W. Marks, 2953 Archer avenue.

ARNOLD W. ZIMMERMANN, 10,571 Meridian avenue, Chicago, has the contract for the plumbing and drainage in the residence of George Morrison, 104th and Charles streets.

The Globe Soldering Furnace.

The accompanying illustration shows the Globe soldering furnace manufactured by Couch Brothers, Dayton, Ohio. This new Globe furnace which the concern have brought out has a stationary generator so arranged that the flame will light the burner from the generator. Special attention is called to their new goose head generator, which is described as an entirely new feature. The construction of the goose head is simple and very efficient in the production of gas. It is noted that the shape and construction of the burner is such that it will not clog up by the dripping of solder. It is said to be very quick in heating and melting metal and another advantage is its lightness, it weighing about 11 pounds and being but 10 inches in hight.

The Globe Soldering Furnace.

A bill has been prepared for presentation to the New York Legislature authorizing the erection of a bridge over the East River from Grand street, New York, to Broadway, Williamsburg. The project meets with general support, and it is proposed that the two cities unite in erecting the new structure in the same manner as was the case with the existing Brooklyn Bridge. The necessity of additional means of transportation other than by ferryboat is daily becoming more pressing, as the inhabitants of the Eastern District of Brooklyn have found to their cost on several occasions during the past winter when ice or fog have prevented the regular running of the ferry steamers.

THE TIN SHOP.

Pattern for Offset, Oblong to Round.

From E S., *New York.*—In Fig. 1, let A B C D E F G H represent the elevation of an offset, oblong to round. A B G H represents the round pipe, C D E F the oblong, and B C F G the transition from oblong to round. In the plan, J K L M represents the round pipe, N O P Q R S the oblong, and J N S, L P Q the two triangles necessary to effect the transition. Two sections of cones are also shown by J K N O P L and J M S R Q L. As a cut through a cylinder oblique to its axis is an ellipse, the cut through the cylinder A B G H produced by the line B G will be an ellipse. A similar result will be produced by cutting the oblong C D E F by the oblique line C F. In order to obtain the pattern of B C F G of elevation, it will be necessary to obtain the shapes on lines B G and C F.

In Fig. 2, C D E F represents a duplicate of oblong shown in elevation by similar letters. To obtain the shape of cut on line C F, proceed as follows: Above and in line with C D E F draw the half plan of oblong, as shown by D N O P E. Divide the semicircle N O P into any convenient number of equal parts, as shown by the small figures. With the blade of the T square placed at right angles to D E, drop lines cutting C F. With the T-square placed at right angles to C F, and brought against the points in C F, draw lines, extending them indefinitely, as shown. Measuring in each instance from C F, set off on the lines just drawn the same length as similar lines in D N O P E, and through the points thus obtained trace a line, as shown by *n o p*. Then C F *p o n* is the half shape of cut on the line C F. In Fig. 3, A M H represents the half profile of round pipe, above which is drawn the elevation of same, as shown by A B G H. To obtain the shape of cut on line B G, divide the half profile A M H into the same number of parts as was N Q P, and with the T-square placed parallel with A B, and brought successively against the points in A M H, carry lines cutting B G. With the T-square placed at right angles to B G, and brought against the points therein contained, erect perpendiculars, as shown. Measuring in each instance from B G, set off on the lines just drawn the same length

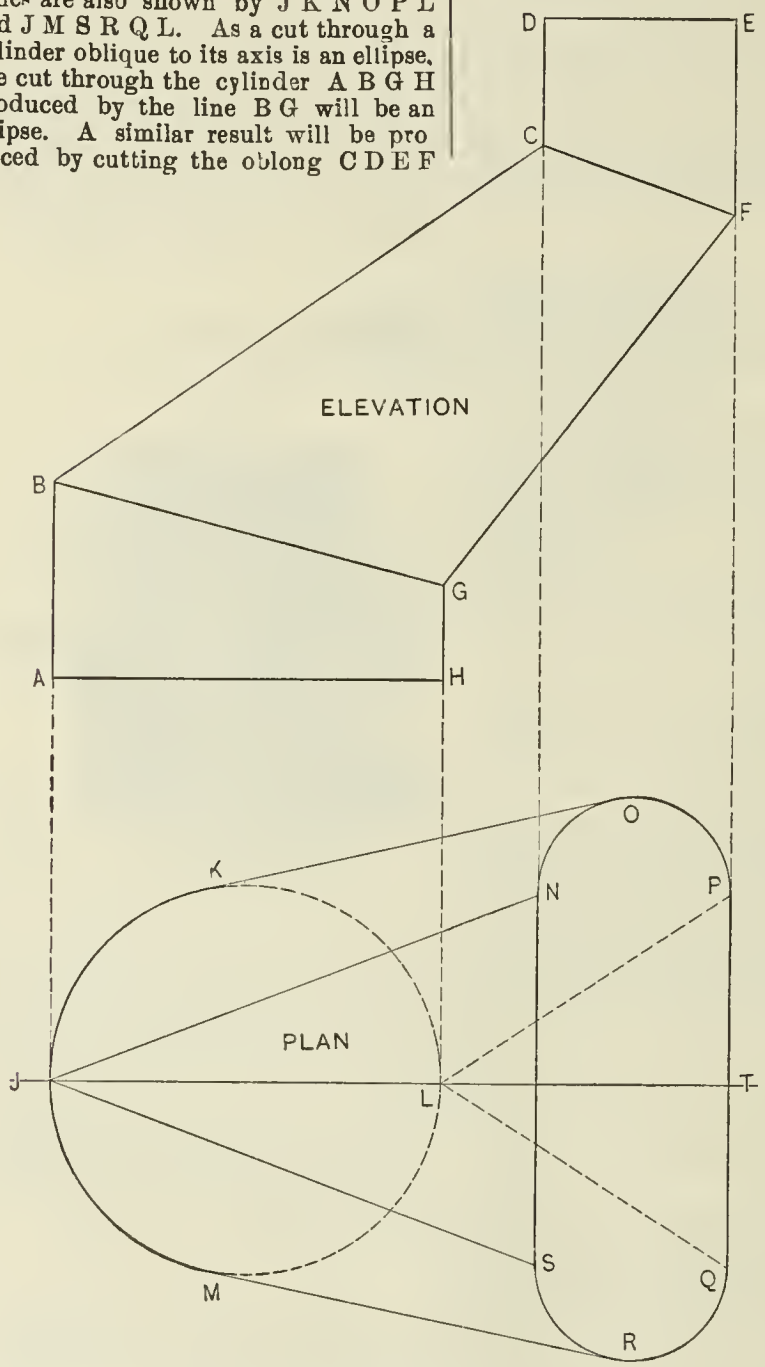


Fig 1.—*Plan and Elevation.*

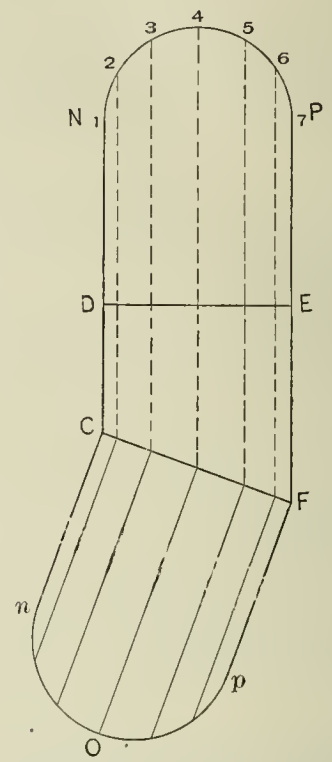

Fig. 2.—Method of Obtaining Shape on Line C F of Elevation.

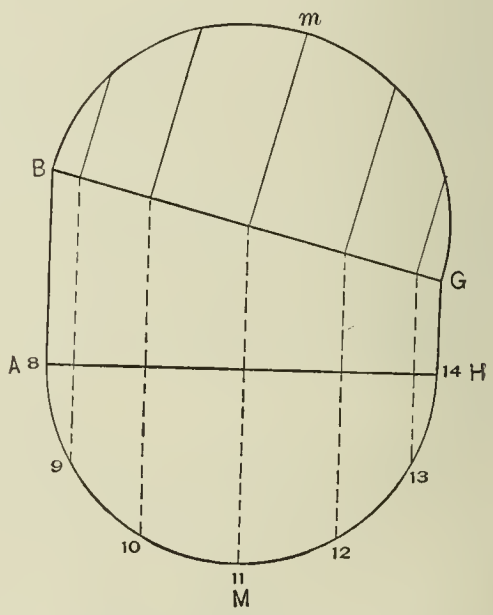

Fig. 3.—Method of Obtaining Shape on Line B G of Elevation.

PATTERN FOR OFFSET.

as similar lines in A M H, and through the points thus obtained trace a line, as shown by B *m* G. Then B *m* G is the half shape of cut on line B G. An inspection of the elevation will show that B C F G is the shape of that part of article on line J T of plan. In order to avoid a confusion of lines, a duplicate of B C F G is presented in Fig 4. On C F is drawn the shape C *n o p* F in Fig 2, and on B G the shape B *m* G in Fig. 3. Connect the points in B G with those in C F, as shown by the solid lines, and also by the dotted lines. The up at right angles, to construct divisions that will give the distance from points in B *m* G to points in C *n o p* F,

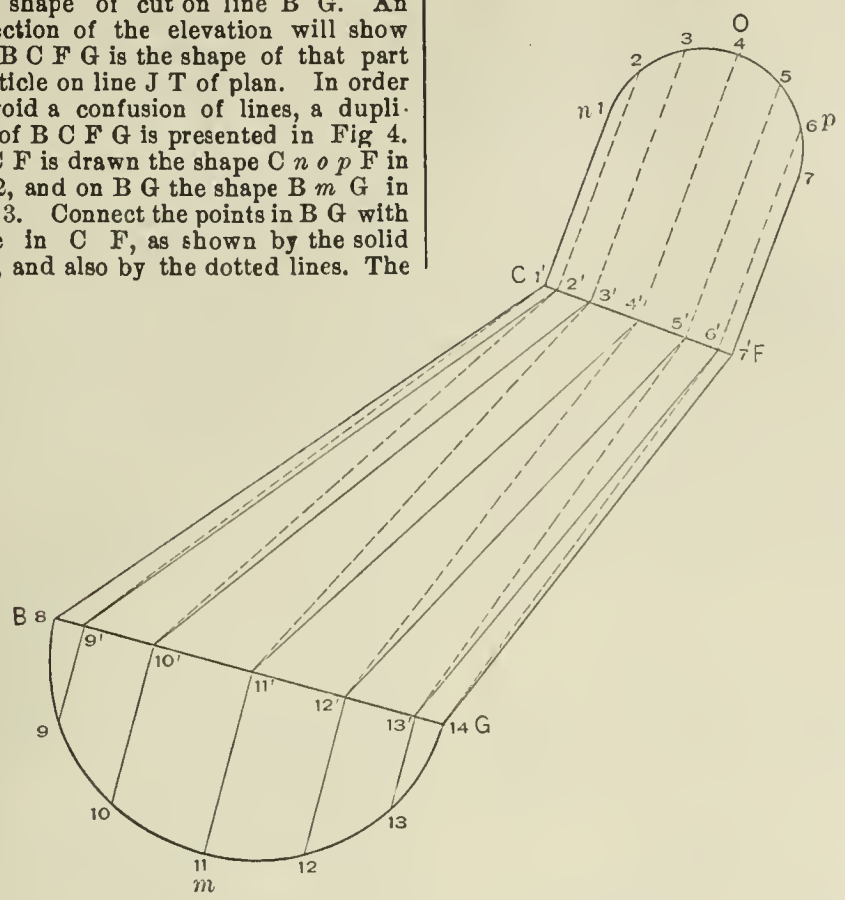

Fig. 4.—Divisions Drawn on B C F G of Elevation.

lines in B C F G of Fig. 4 are shown in Fig. 5. To construct these divisions proceed as follows: Draw the right angle U V W. From V, on V W, set off the length of lines in B *m* G, Fig. 4. From V, on V W, set off the length of lines in B C F G, and from the points thus obtained erect perpendiculars in length equal to lines of similar number in C *n o p* F, Fig. 4. Thus make line W 1′ of Fig. 5 equal to line C *n* of Fig. 4, and draw V 1′, which gives the distance from point B to point *n* in Fig. 4 as if measured on the finished article. Connect the perpendiculars drawn from V W with the points in V U, as shown, and corresponding with the figures in Fig. 4. Thus connect 1′ and 8, 2′ and 9, 3′ and 10, &c. The divisions shown in Fig. 6, which correspond with the dotted lines in Fig. 4, are constructed in a similar manner. Draw the right angle X Y Z, and from Y set off the length of lines in C *n o p* F. From Y, on Y X, set off the length of dotted lines in B C F G, and from the points thus obtained erect perpendiculars, in length equal to lines of similar number in C *n o p* F, as indicated by the small figures. Connect the perpendiculars drawn from X Y with the points in Y Z, as shown, and corresponding with the figures in B C F G. Thus connect 1 and 9′, 2 and 10′, 3 and 11′, &c.

In the pattern, Fig 7, *x s r g t* represents the stretchout of C *n o p* F, as *j m l* does of B *m* G. To obtain the pattern shown in Fig. 7, using for the

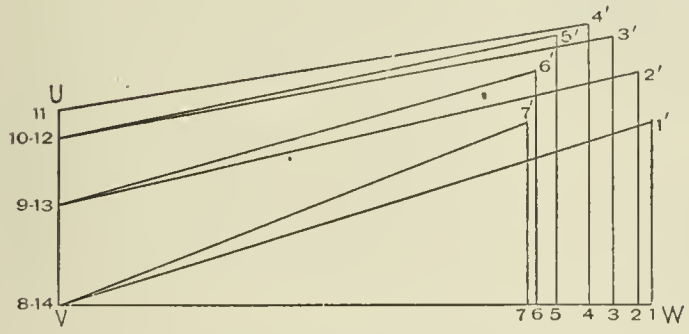

Fig. 5.—Divisions Represented by Solid Lines in Fig. 4.

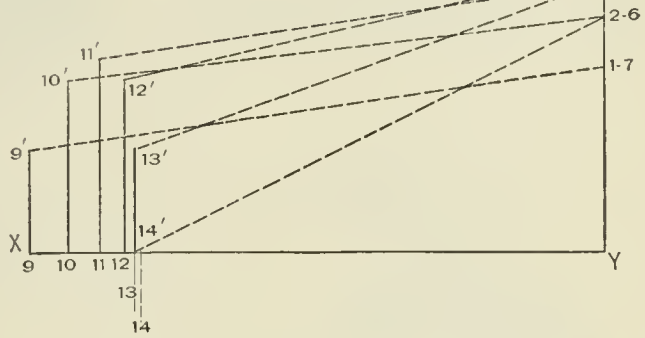

Fig. 6.—Divisions Represented by Dotted Lines in Fig. 4.

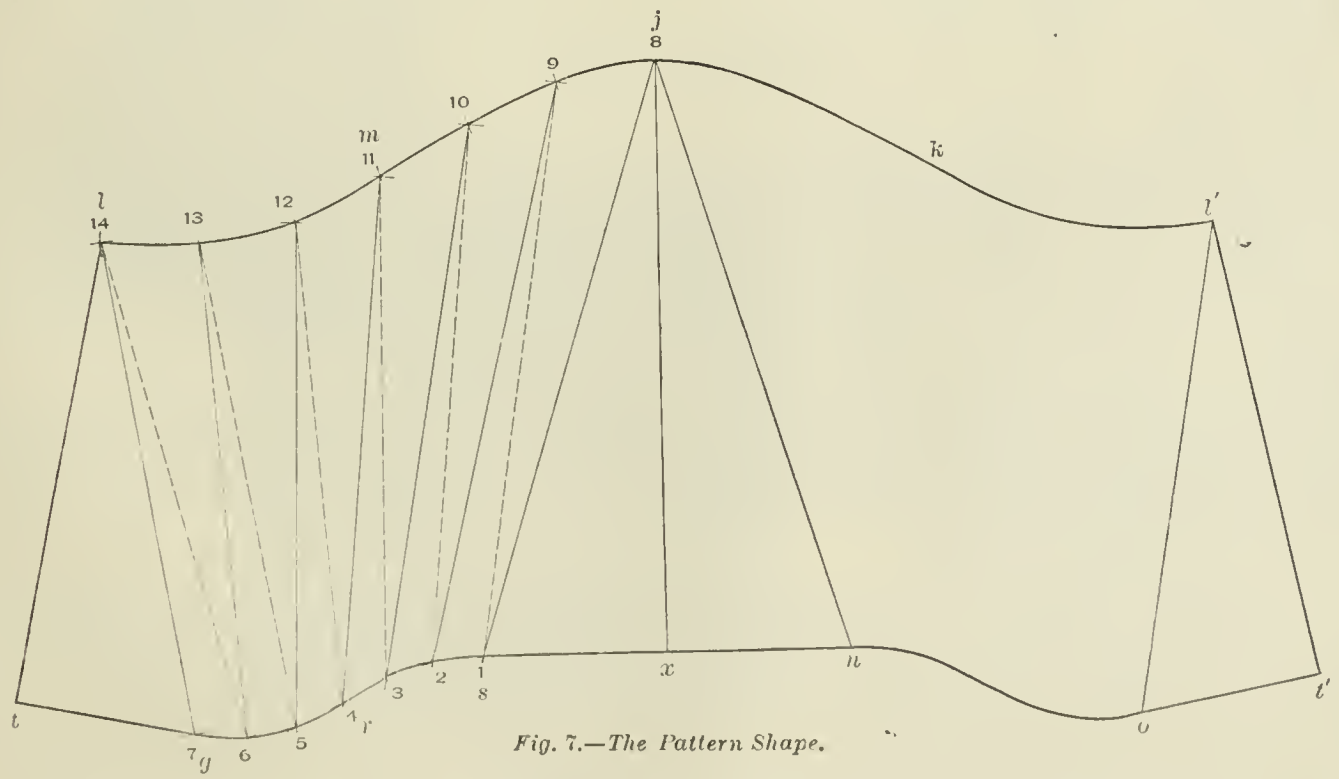

Fig. 7.—The Pattern Shape.

PATTERN FOR OFFSET.

method we shall pursue for obtaining the pattern will be as follows: Supposing B *m* G and C *n o p* F to be bent as indicated by the solid and dotted lines in B C F G, Fig. 4.

The divisions represented by solid purpose diagrams 4, 5 and 6, proceed as follows: At any convenient place draw the line *j x* of pattern in length equal

to V W of Fig. 5. With *x* as center, with radius W 1′ of Fig. 5, describe a small arc. With *j* as center, with radius V 1′, describe a small arc intersecting the one just drawn, thus establishing the point *s* in pattern. Draw *x s* and *s j*. From the point *j* as center, with B 9 of Fig. 4 as radius, describe a small arc, as shown; then, with *s* as center and 1 9′ of Fig. 6 as radius, describe another arc intersecting the other, thus establishing point 9 of pattern. With point *s* of pattern as center, and *n* 2 of Fig. 4 as radius, describe a small arc, which intersect with one struck from point 9 as center, and 9 2′ of Fig. 5 as radius, thus establishlishing point 2 of pattern. Proceed in this manner, using the tops of sections in Fig. 5 for the distances represented in pattern by the solid lines, the tops of sections in Fig. 6 for the distances represented by the dotted lines, the stretchout of *n o p* for the distance between points in *s r g*, and the stretchout of B *m* G for the distance between points in *j m l*. Trace lines through the points thus obtained, as shown. From *g* of parallel to the stretchout line, and, bringing it successively against the points in C F, cut corresponding measuring lines. Trace a line through the points thus obtained, as indicated by F″ C″. which forms the desired pattern. In Fig. 9, A B G H represents the round part of offset, as indicated by similar letters in elevation. A M H is the half profile. The half pattern, as shown by G″ B″ A″ H″, can be obtained from Figs. 1 or 2, but as in the previous instance, for the purpose of avoiding a confusion of lines a separate diagram is used. To obtain the pattern divide the half profile A M H into any convenient number of parts. Place the T-square

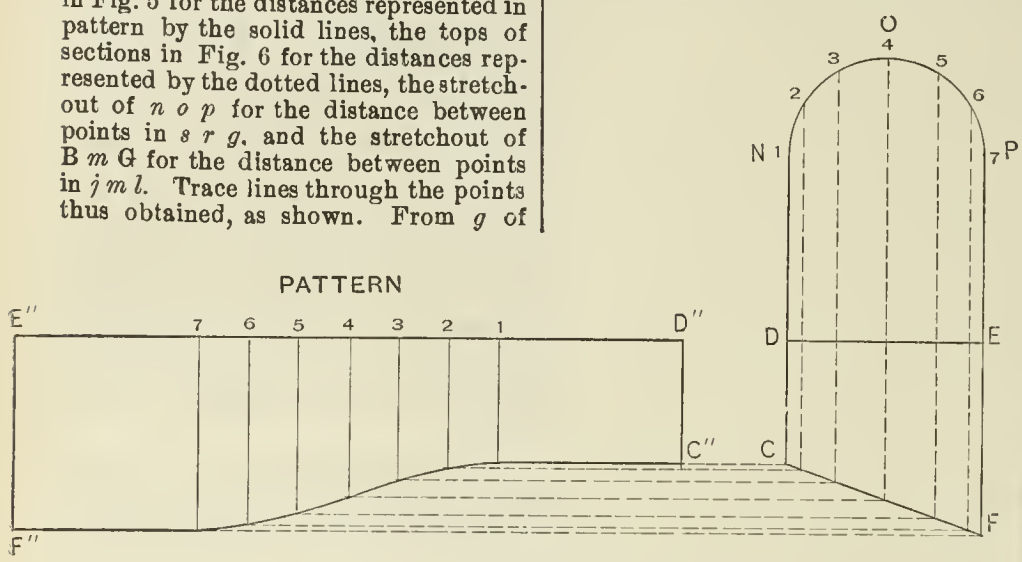

Fig. 8.—Half Pattern of Oblong Part.

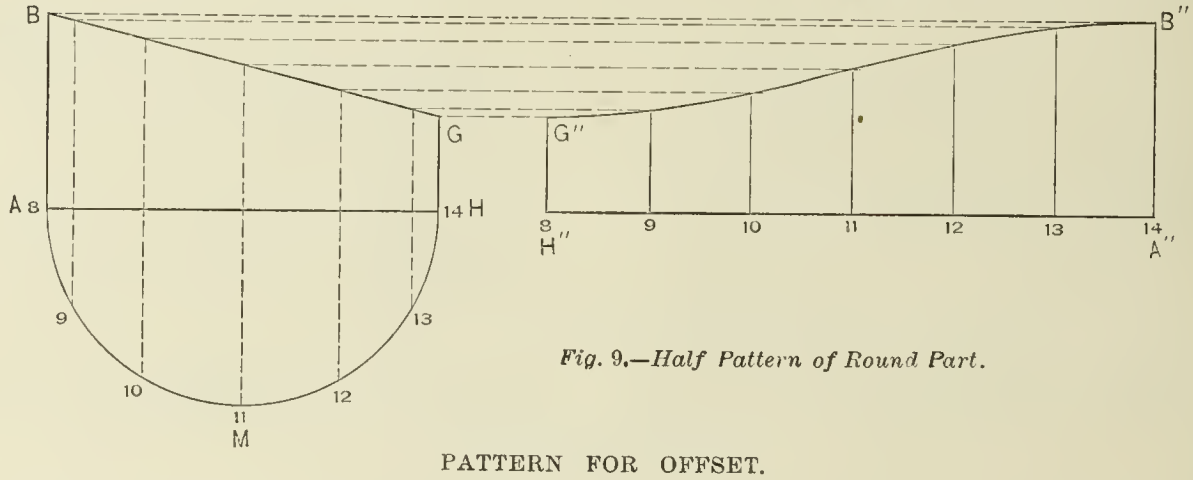

Fig. 9.—Half Pattern of Round Part.

PATTERN FOR OFFSET.

pattern as center, with radius 7 7′ of Fig. 5, describe a small arc, which intersect with one struck from *l* of pattern as center and radius V 7 of Fig 5, thus establishing point *t* of pattern. Draw *l t* and *t g*, which completes the half of pattern. The other half can be obtained in a similar manner or by duplication.

The pattern of oblong part of offset, as shown by C D E F of elevation, or N O P Q R S of plan, can be obtained from Figs. 1 or 2, as may be desired. To avoid a confusion of lines the half pattern is obtained, as shown in Fig. 8, in which C D E F represents the elevation and D N O P E the half profile. To obtain the half pattern proceed as follows: Divide N O P of profile into any convenient number of parts, as indicated by the small figures. Place the T-square parallel with C D, and, bringing the blade successively against the several points in the profile, drop corresponding points on the miter line C F, as indicated by the dotted lines. On D E extended lay off a stretchout of D N O P E, and through the divisions draw the usual measuring lines, as shown. Place the blade of the T-square parallel with A B, and, bringing the blade successively against the several points in the profile, drop corresponding points on the miter line B G. On A H extended, as H″ A″, lay off a stretchout of A M H, and through the points thus obtained draw the usual measuring lines, as shown. Place the blade of the T-square parallel with the stretchout line H″ A″, and, bringing it against the several points in B G, cut corresponding measuring lines. A line traced through the several points thus obtained, as indicated by G″ B″, will form the desired pattern.

The Star Coupler Company, St. Louis, Mo., advise us of an order of considerable dimensions just received from the War Department of the United States to be delivered at Madison Barracks, Sackett's Harbor, N. Y. This order is the result of a sample lot sent in December last which were thoroughly tested and which the consulting engineer of the barracks, E. C. Knowlton, reported he had tested and found satisfactory under all conditions. The Star Coupler Company also advise us that the town of Staunton, Ill., began tapping the mains a week ago and are using the Star coupler exclusively in making the necessary connections. The same thing prevails in Venice, Ill.

The Hardening of Aluminum.

A tale which savors strongly of the romantic has come from Canada to the Boston *Herald*, and, after publication in that journal, has been reprinted in nearly all the daily and weekly newspapers. It is to the effect that F. Allard, the Canadian blacksmith "whose rediscovery of the lost Egyptian art of hardening copper stirred the mechanical world some three or four years ago," has recently succeeded in hardening aluminum, so as to give it the consistency and resistance of iron. According to the story, Mr. Allard has made a small cannon out of his hardened metal from which he is alleged to have obtained some astonishing results. The personality of the discoverer, as detailed in a special dispatch from Quebec to a leading New York paper, is calculated to lighten the impression of romance which surrounds this tale, being very suggestive of the ancient alchemists with their mysterious ways and occult arts. He is described as being an aged man who works in seclusion and who is very likely to die without revealing the secrets of the hardening of aluminum and copper which he holds, unless he is adequately rewarded for the discovery, the inference being that no time must be lost by capitalists in paying him for the precious secrets which he claims to possess. The redlscovery of the art of hardening copper, we are told, only failed to make the fortune of the ingenlous blacksmith "because of the expensiveness of the process." Will the present alleged discovery prove any more profitable to the author or to the world at large?

The Chilian Government has announced its intention of buying up all the existing railroads in the Republic in order to place them under State management.

Rumors, which have been flying around with some persistence during the week, assert the probability of a consolidation of the great electrical manufacturing interests of the country, including such corporations as the Westinghouse and the General Electric companies, placing them under the control of Standard Oil capital. This new gobble of that omniverous corporation has received a half-hearted denial from several parties interested in the reputed deal, yet the news contlnues to be reiterated.

THE RETAIL STORE.

Iron Platform for Cisterns and Wells.

The Bucket Pump Company, Cincinnati, Ohio, are introducing an iron platform for cisterns and wells in connection with their bucket pump as here shown. The platform, Fig. 1, is made

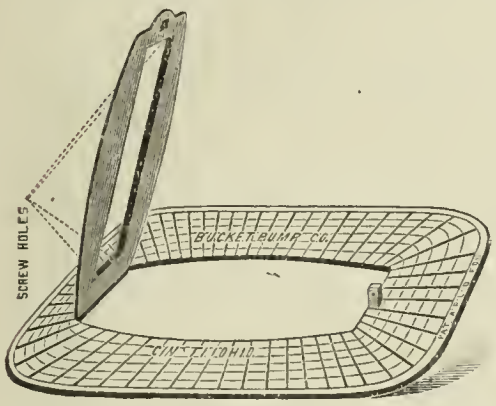

Fig. 1.—Iron Platform for Cisterns and Wells.

in two parts, the center portion being hinged, permitting it to be opened at right angles, leaving an opening 16 x 24 inches in size. The platform is corrugated, having an outward fall, also a small flange at the edge of the opening in the movable portion, into which the curb sets, to prevent filth, sediment, *débris*, &c., coming in contact with the water. The flange is fitted closely to the lower edge of the pump curb to prevent the water spreading and causing the curb to decay. The curb is permanently attached to the movable portion of the platform, as in Fig. 2, by screws, the position of the screw holes being shown in Fig. 1. This arrangement permits of ready access to the cistern or well, without removing screws, bolts, pump or platform, when it is desired to make repairs either to the cistern, well or pumping apparatus. The curb in such cases is turned back, when the chains swing back out of the way. When the repairs have been made the curb is turned again into position and a cotter is passed through the small lug at the front of the curb to hold the whole firmly in place. The manufacturers refer to the platform as strong, easily placed in position, and as inexpensive.

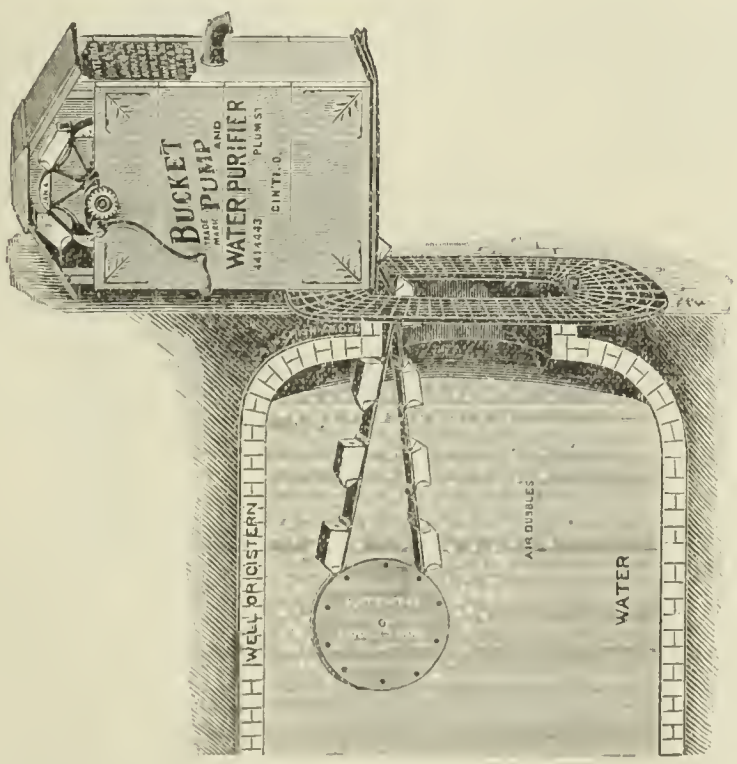

Fig. 2.—Pump Attached to Platform.

The Champion Roaster or Oven.

Illustrations are herewith given of a small portable oven which has just been brought out by the Leach Roaster & Baker Company of Paxton, Ill. The oven is compact in form and the shape makes it convenient to be used with great advantage on gasoline, gas, oil or coal stoves. It only requires a moderate heat and is stated to be practically automatic in its functions, requiring no basting. It has an air chamber which diffuses the heat equally throughout.

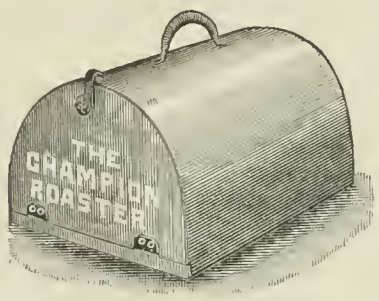

Fig. 1.—The Champion Roaster or Oven.

There are numerous uses for small portable ovens of this character which will suggest themselves to those who are familiar with cooking requirements. One special use is mentioned, however,

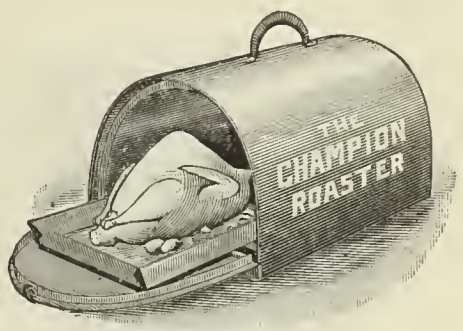

Fig. 2.—Roaster or Oven in Use.

in the fitness of this oven for camping parties.

West's Dust Pan.

James R. West of Gas City, Ind., is manufacturing the new dust pan which is herewith illustrated. It has a tread extending from the bottom of the pan, upon which the foot of the operator can be placed, which holds the pan firmly in position, enabling it to be used with a broom, thus avoiding the necessity of getting on the knees with a brush or stooping over. The pan has a large hood and the handle is very conveniently arranged.

West's Dust Pan.

REPRESENTATIVES of the various hardware firms of Milwaukee, Wis., met on the 11th inst., and decided to accept the proposition of the Milwaukee Gas Light Company in regard to selling gas ranges. From April 1 to August 1 gas ranges without water heaters can be bought at about half price and in addition the gas company will set the stoves in position, lay pipe and make connections free of charge. The company will pay to the hardware dealers the difference between the regular price and the new price.

Porcelain Lined Milk Delivery Can.

The Stuart & Peterson Company, Burlington, N. J., have augmented their line of Golden Crown ware by the addition of the porcelain lined milk delivery can here shown. It is made of cast iron, has a porcelain lining, and is supplied with either glass or porcelain lined iron covers. The article is designed to supersede glass jars and tin cans, over which it is said to possess an advantage, inasmuch as glass jars readily break and tin cans rust, and both have small necks which condense foul odors in cleaning. Another advantage it possesses is that it may be placed on a stove and the milk sterilized. It is made in sizes holding one and two quarts.

Porcelain Lined Milk Delivery Can.

Stove and Hardware Dealers Along the Hudson River.

BY HENDRICK.

At the foot of the Catskill Mountains and along the western shore of the historic Hudson are many flourishing towns in which will be found enterprising stove and hardware dealers.

At Catskill, N. Y., Day & Holt have been doing business for the past ten years. The firm is composed of J. Day and Samuel Holt. Mr. Day is also secretary of the Catskill Savings Institution, so that he devotes but little time to the hardware business. Mr. Holt can always be found in his office attending to the details of the business. The firm carry a large stock of heavy and shelf hardware, mechanics' tools, agricultural implements, stoves, ranges, &c. Of late they have given up considerable of their floor space to bicycles, which has grown to be an important branch of the trade. The Western Wheel Works' Crescent and the Overman Wheel Company's Victor are the leading goods handled by them. The firm also do a large plumbing, steam and hot water heating business, representing the Boynton Furnace Company of 214 Water street, New York. They have had excellent results from their hot water and steam heaters during the past winter. Mr. Holt is a firm believer in selling one line of ranges and stoves, and during the past four or five years they have pushed the sale of the Rochester Co-operative Stove Company's Red Cross ranges and stoves.

At the corner of Church and Main streets Russ & Beach have been doing business since 1860. They carry a large stock of general hardware, stoves, ranges, &c. Their leading lines of parlor stoves are the Fuller & Warren Company's, P. P. Stewart and the Splendid Diamond. Probably no other dealers along the Hudson River have sold more West Shore ranges than this concern, their sales running up in the hundreds on this popular range. They enjoy a good trade from the farmers, their place of business being conveniently located at the head of the street where they drive in to town.

Peary & Lobdell, in 1891, succeeded Brooks Brothers, and now occupy the large store on Main street, where they carry a stock of hardware and stoves and do a general tin and plumbing business. They enjoy a large trade on Rathbone, Sard & Co.'s Acorn and Philips & Clark Stove Company's Andes ranges and stoves. The young men have been very successful since their start in business four years ago.

The Richardson & Boynton Company are represented in Catskill by Adams & Spencer, who do a thriving business in steam and hot water heating, plumbing and tinning. They have built up a good trade on the company's Perfect line of ranges and furnaces.

Henry T. Jones & Son do considerable in tinning and plumbing. This firm are an important factor in the completion of Catskill's plumbers and tinners.

Ten miles up the Catskill Mountain Railroad is the summer resort of Cairo, noted in summer for city dudes and in the winter for its immense snowbanks. It is here that Decker & Olmstead have a model country tin and hardware store. They carry a good stock of hardware, tinware, stoves and agricultural implements, their leading line being the Syracuse Stove Company's Welcome ranges and heaters.

Frank M. Halstead carries on the stove and tin business at Ravena, selling the Fuller & Warren Company's Splendid Diamond and P. P. Stewart stoves.

At the same place is A. M. Stuvill, who sells the Perry Stove Company's Argand line. Healso carries a line of hardware, and does a general tin and jobbing business.

J. B. Holmes & Son carry on the stove and tin business at Coeymans. Mr. Holmes senior is an old settler in that part of the country, having started in business long before the late war. He often looks back, and refers to the time when they made their own tinware from plates free from the pin hole difficulty which is so prevalent among the tin plates of to-day. They carry a line of hardware, tinware and stoves, selling the Fuller & Warren Company's line of Splendid stoves, which have had a large sale with them.

At Coxsackie W. R. Church has been in business for many years, and carries a complete line of heavy and shelf hardware, tin, wooden ware and agricultural implements. He enjoys an excellent trade among the farmers for many miles back in the mountains. His leading lines of ranges and stoves are the Rochester Co-operative Stove Company's Red Cross, Van Wormer & Co.'s American heater and D. G. Littlefield's famous West Shore range.

W. A. Edwards occupies a large store on the main street, where he carries on a thriving business, selling the Perry Stove Company's Argand and Orr, Painter & Co.'s Sunshine. "Will," as he is known among the traveling men, prefers at any time to sit with them and tell funny stories rather than to buy goods, and he has many funny ones in store for those who are yet to visit him. He has recently remodeled his store, and it now presents an attractive appearance, and he will, no doubt, continue to enjoy a good trade among his many friends as in the past.

MEMORANDA.

HAMMER & FOWLKES have succeeded to the stove and hardware business at Bakerville, Tenn., formerly conducted by W. H. Fowlkes.

WADE BROTHERS, Prattsville, N. Y., have succeeded A. M. Allen, dealer in hardware, tinware, stoves and crockery.

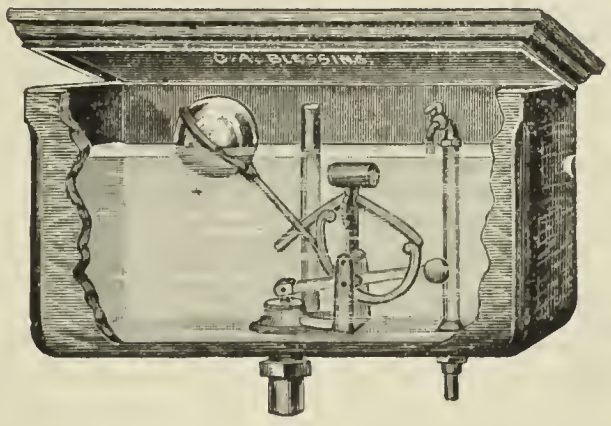
THE G. S. BLODGETT COMPANY, Burlington, Vt., have purchased the stock and good will of A B. Kingsland & Co., of the same city, who have been dealers in stoves, tinware, &c., and have also conducted a plumbing, gas and steam fitting establishment. This consolidation makes the G. S. Blodgett Company one of the largest heating and plumbing concerns in northern New England. The latter firm have for a number of years done a large business in the above lines, and besides are known to the trade generally as manufacturers of the Blodgett portable oven, which is especially adapted for use in hotels, restaurants, steamships and large institutions, and is also used for japanning, core baking and the manufacture of confectionery. This business was established over 40 years ago by Blodgett & Sweet. The ovens were first manufactured by this concern and are now known all over the world. This firm continued for 20 years and then were succeeded by G. S. Blodgett and E. P. Manor, under the style of G. S. Blodgett & Co. Ten years later Mr. Manor died and George H. Holden took his place in the firm. The concern were incorporated in 1892 and continue as the G. S. Blodgett Company.

C. SIDNEY SHEPARD & Co., Chicago, Ill., issue a pretty little leaflet with the title "A Few Words About Aluminum and Aluminum Kitchen Utensils." The two inside pages give some interesting facts about aluminum covered by an article recently printed in *The Metal Worker*, from which long extracts are made. On the back of the leaflet it is stated that they have in preparation a catalogue of aluminum articles, some of which they mention by name.

E. E. KOHLER has purchased the stock of hardware of M. D. Comstock, Byron, Mich., and will continue the business and will likewise carry on a tin shop, which has been his line of work.

The returns of the Chief of the Bureau of Statistics at Washington for the month of February show that the imports into the United States during the month exceeded the exports by $2,017,809. In February, 1894, the expoits exceeded the imports by $11,812,190. During the eight months ended February 28, 1895, the excess of exports over imports was $91,967,932, and the excess for the corresponding period of the preceding year was $218,061,832.

The Pennsylvania State Legislature has passed a bill appropriating $500,000 for the improvement of the channel of the Delaware River.



PLUMBING and GAS FITTING.

Public Conveniences.

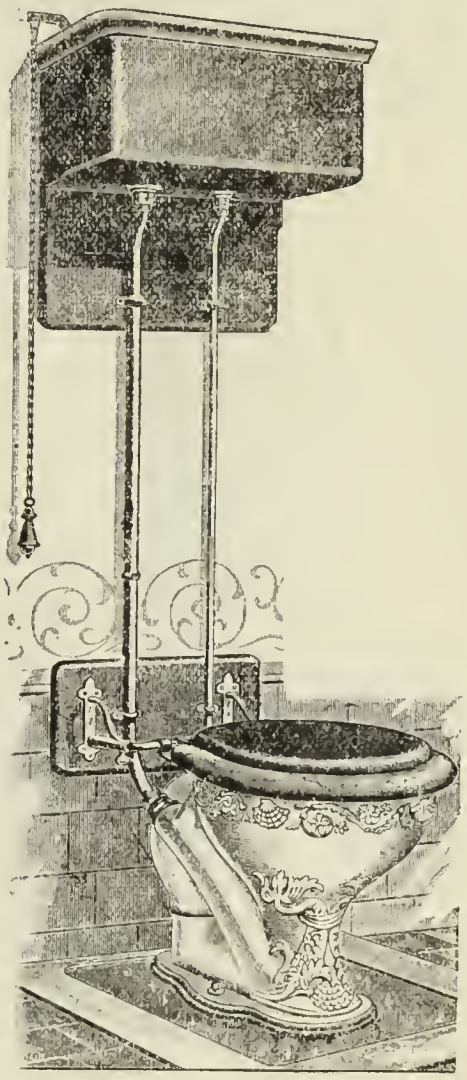
The large cities of the United States are wretchedly equipped with public conveniences. The rule to leave the public to provide or do without them is so general that even the exception to prove it is difficult to discover. The need of these public conveniences was never made so clear as by a recent order from one of the public departments of the city of New York. It commands that none of its employees shall enter saloons during working hours, which, on its face, seems commendable. These employees, however, are collectors of ashes, garbage, &c., and would not be permitted to use the urinals and closets of stores, restaurants and hotels by the proprietors. The order has been broken by honest, hard working, well meaning men, who, as a result, have been discharged. If proper public conveniences were provided at frequent intervals throughout the city this hardship would not have been incurred, and owners of property having an open alley or driveway would have fewer nuisances to complain of. The plumbers would do well to bring their influence to bear on this matter.

Universal Urinal Tank.

C. A. Blessing, Philadelphia, has patented and is introducing to the trade the Universal urinal tank shown in the illustration herewith, which is designed for flushing urinals, hoppers and latrines. The tank is simple in construction and is described as being absolutely reliable in operation. The

Universal Urinal Tank.

parts are few in number. There is no ball cock used, the water entering by the supply pipe and cock seen at the right of the cut. The valve is operated by a balanced lever controlled by a fork which is combined with the valve stem. When the water entering the tank reaches a point about 1 inch from the top the ball float reaches its highest point and the end of the fork nearest the ball strikes a lug on the front of the weighted lever balance, causing it to fall on the disengaged end of the valve lever and thus open the outlet. As the water is discharged and the float falls, the fork from the other side turns the balance weight over again, thus closing the valve. The tank then fills for another discharge. The discharges are regulated by the supply cock, which may be set to admit more or less water according to the number of flushes required. The tank fittings are adapted to small tanks as well as large by simply bending the fork to bring the ends closer together. The tanks are furnished in cherry, ash, oak, maple and walnut.



James M. Heatherton.

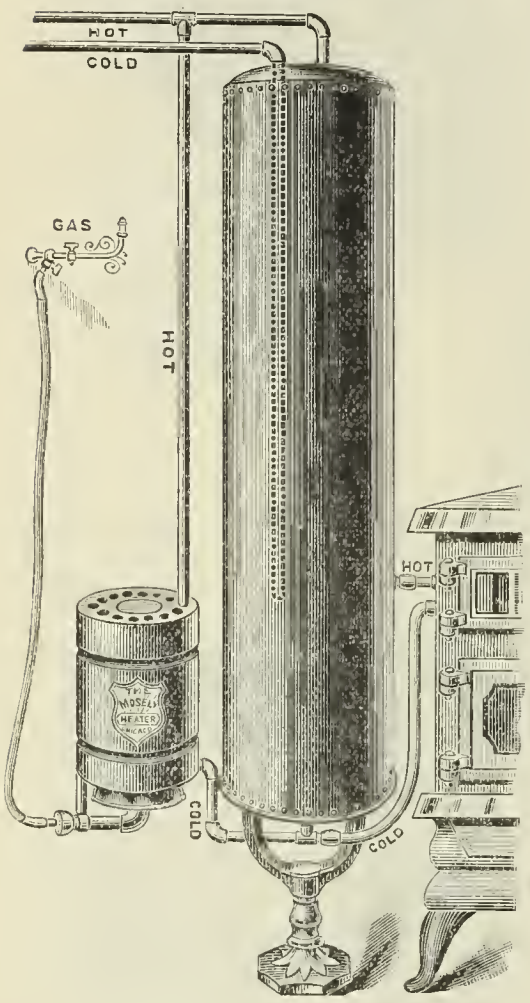
The many friends of James M. Heatherton in the plumbing trade will learn with regret of his death on March 20, at his home, 773 Monroe street, Brooklyn, N. Y. The funeral services will be held at the house at 1.30 p.m. to-day. Those who desire to attend should take the East New York elevated road at the Brooklyn Bridge and stop at Gates avenue station. Mr. Heatherton was born at Albany, N. Y., in 1841, and at an early age was apprenticed to Ridgway & Russ of that city, at the plumbing trade. He left their employ and opened a plumbing shop in New York in 1859, where his trade grew, and he at one time ran three shops at 159 Mercer street, 35 Ann street and at 1690 Third avenue. He continued in the plumbing business until 1887. Among his notable jobs was the plumbing in the Post Office Buiding, which is now being remodeled. In 1880 the *Plumbers' Trade Journal* was started and later occupied his whole time. Mr. Heatherton entered the late war as a private, but rose to the rank of colonel at its close, and was a member of a number of social and secret societies. He leaves a widow, three sons and four daughters.

SANITARY EXPERT THOMAS S. AINGER of Detroit has made his report to the Board of Health of Saginaw, Mich., and strongly condemns the sanitation of the court house and jail. The supervisors will be called upon to remedy the defects as speedily as possible.

The New Era Siphon Closet.

A new combination siphon jet water closet is shown in the picture herewith, and is called the New Era by the manufacturers, the John Douglas Company, 162–166 Poplar street, Cincinnati, Ohio,

The New Era Siphon Closet.



who also have a branch house at 131 Lake street, Chicago, under the management of Geo. L. Bottom. The closet is of ornamental design, and so constructed, it is claimed, that it works noiselessly, discharging its entire contents at once. The wood work in the seat, flush tank and bracket support is well finished and in a way to stand hard service. The seat and cover are detached from the closet and supported by means of brackets secured to the wall. For roughing in, 12½ inches should be allowed from the face of the wall to the center of the outlet of the closet. Every closet is tested and all the metal trimmings are nickel plated.

THE Board of Health and plumbers' inspectors of Cohoes, N. Y., held a joint meeting last week and adopted a set of rules and regulations similar to those in use in Troy. The rules were ordered printed in pamphlet form and published in the city newspapers. Following the joint meeting a meeting of the plumbers' inspectors was held and a committee consisting of Messrs. Bottum, Cady

and Swatling was appointed to draft by-laws, &c. The board also decided to visit the Troy Board of Plumbers' Inspectors and get an idea from them what was necessary to be done and have their duties defined.

The Mosely Circulating Water Heater.

The Mosely Folding Bath Tub Company, 161 South Canal street, Chicago, have brought out a new water heater, which is herewith illustrated. It is designed for use in connection with a range boiler, and is furnished with Mosely's improved gas, gasoline or oil burner, as desired. It contains 32 feet of copper coil. The illustration shows the method suggested for its use.

The Mosely Circulating Water Heater.

When connected in this manner the range or water heater can be used separately or at the same time. This method of connecting the heater affords the advantage of furnishing hot water at once and always drawing the hottest first. The manufacturers claim for this device high heating efficiency and minimum consumption of fuel. It is made in three styles of finish—polished black iron jacket, polished copper jacket and copper top, or nickel plated copper jacket and nickeled top and fittings.

THOMAS J. CUSACK has removed from Fair street to his former old store, 45 North Front street, Kingston, N. Y., which he is having thoroughly renovated and improved. The basement is being converted into a modern workshop, while the main floor or display room is undergoing decided changes. One section will be devoted to an exhibition of garden hose and another to steam and hot water ranges &c. A special feature will be one of the large show windows, which will be constructed and furnished like a modern bathroom.

Operation of Siphon Closets.

From S. C. P. C., *Sioux City, Iowa.*—Will *The Metal Worker* be kind enough to give a theoretical explanation of the operation of a siphon tank and closet?

Answer.—The various tanks in use have many different kinds of valves, all operating on the principle of using the pull to put the valve in operation. Water from the tank rushes down the flush pipe to the closet, and if the pull is released at once the valve will resume its seat, and water will be drawn through an inverted U-shaped pipe or some construction answering the same purpose by siphonic action, and will continue until the water in the flush tank falls below the end of the short leg of the siphon, when the flush will stop and the tank fill up until the supply is cut off by the ball cock used in connection. The water, on reaching the water closet, by its construction is made to thoroughly scour and flush the internal surface of the closet, while a jet enters at the bottom of the trap and shoots toward the trap outlet. The shape of the waterway from the trap to the soil pipe is so arranged as to create a spray and retard the flow of the water through it so as to flush and fill the waterway from the closet to the soil pipe. Then, through a larger surface of water being exposed to atmospheric pressure in the closet than there is at the soil pipe, a siphonic action is induced and continued until the contents of the closet have been disposed of and the siphonic action broken. This occurs before all of the water from the flush tank has escaped and the after flow seals the trap.

Burst Pipes.

A plumber corresponding with an English journal in reference to pipes bursting from freezing gives an interesting account of some experiments as follows:

For trial, any strength pipe would do, but for a simple demonstration, take about 20 feet of light ½ or ¾ lead pipe. Put a stop tap at one end and a bib tap at the other. Fill this pipe by a hose, shut the bib tap, then the stop tap tight, double the pipe with an easy bend, cut a hole through a wall into a warm room, then put the double pipe inside with the taps outside, and gradually draw them out about 1 foot at a time to allow them to freeze up from the taps, and by the time the pipes are nearly all drawn out the burst will take place in that part not frozen or last to freeze.

Again, take the same pipe, filled as before, and draw out one end only; the burst will then take place at the end not frozen or last to freeze close to the tap inside.

Again, take the pipe and fill it, then put the end with the bib tap inside. Open it, put a bottle or can to catch the water, and then draw out as before, and as it freezes it will push the water into the bottle, and no burst can or will take place on any part of the pipe swollen.

Again, take the same pipe as before, shut off both ends, expose it equally, all at once, to frost; no burst will take place, but the pipe will be slightly expanded.

The expansion caused by freezing is great, and will burst almost anything. Why? Because there is no vent or escape for the pressure of the water; but if a passage is kept open to the center, or the last place of freezing, no burst will take place, not even a bottle, if it could be attended to.

Take a simple test, as I have done—a water butt; let it freeze, and before it is half frozen it will burst the butt. But keep the center open with a small iron rod, and though it may get solid, it will not burst. Why? Because the hydraulic pressure is taken away.

Burst pipes are caused by expansion in freezing and forcing the unfrozen water between two given points, and by hydraulic pressure expanding the pipe until it is relieved by a vent.

It is on this principle that pipes are burst by the sudden stoppage with the old fashioned half turned taps. Hence the introduction of the screwdown taps. This I have experienced many times of old when the high pressure of town water was introduced. The burst in these cases is exactly like that by frost.

TRAPS AND VENTS.

REPRESENTATIVE REVELL has prepared, and will introduce into the Illinois Legislature at the first opportunity, says a Chicago daily, a bill to compel gas companies to supply to consumers prepayment meters. The prepayment meter is operated on the slot machine plan. The consumer drops a coin in the slot and a certain quantity of gas is produced. These meters are in use in some of the cities of Europe. It is estimated that if this bill becomes a law it will involve an expenditure for meters by Chicago gas companies of about $5,000,000.

THE PROPERTY of the Cleveland Gas Fixture Company was recently purchased in the Probate Court and will be operated by a new company to be known as the Cleveland Gas & Electric Fixture Company. The new company elected officers recently as follows: President, R. E. Gill; vice-president. Bernhard Schatzinger; treasurer, B. G. Tremaine; secretary, H. L. Taylor. The officers and L. Poplowsky constitute the Board of Directors.

DENNISON, OHIO, it is reported, has raised $30,000 and secured 20 acres of land which is to be used as an inducement to James B. Clow & Son, Chicago, to locate their pipe works there, their works at New Philadelphia having been destroyed by fire.

JOHN VAN DE VELDE has moved his plumbing and steam heating establishment to 27 East Third street, Dunkirk, N. Y.

B. P. CONNEALY has been appointed Pumbing Inspector at Waterbury, Mass.

JAS. F. DUFFY, 124 Main street, Hartford, Conn., has been fitting up his store in a handsome manner so as to display to the best advantage the fine plumbing fixtures, including porcelain tubs, marble lavatories, closets of various kinds and the accompanying nickel work. In the heating line he carries the boilers made by the American Boiler Company.

SINCE ZALMON GOODSELL has become president of the Builders' Exchange, Bridgeport, Conn., the membership has grown from 10 to 70, and the value of the exchange is being appreciated.

GEORGE H. FARRELL, Westfield, Mass., has repaired the damage done his plumbing establishment on Arnold street by fire, and is ready for business again.

THE CITIZENS' GAS COMPANY, Bridgeport, Conn., will establish a plant as soon as possible to supply fuel gas to factories and dwellings.

R. D. WALLACE AND H. J. PLOCK have arranged to open a plumbing, steam and gas fitting establishment in Seneca Falls, N. Y.

ALLEN & WARD, Athol, Mass., have made extensive alterations and enlargements at their plumbing shop in Cardany's Block.

THE PLUMBING SUPPLY HOUSE of Geo. D. Kimber & Co., Brooklyn, N. Y., sustained damage last Sunday night from water used on a fire in the upper part of the building they occupy.

F. J. STURN, Newark, N. J., has taken a store adjoining his plumbing establishment, which he will fit up as a showroom for gas and electric lighting fixtures, and will make a fine display of modern plumbing fixtures.

S. B. PARKER of Goldsboro, N. C., who has been running a plumbing and tinning business for 15 or 20 years, has opened a branch in New Berne, with headquarters on Craven street.

ACCORDING to newspaper report elec tric heat has been applied with success to the thawing out of frozen water pipes in England. A wire is run into the pipe until it meets the obstruction, and then the current is turned on.

E. L. POWELL, Atlantic Highlands, N. J., was a visitor at *The Metal Worker* office this week. Mr. Powell has invented several devices that have proven useful to the plumber.

C. H. ROLLINS is remodeling his plumbing store in Watertown, Mass.

PLUMBING INSPECTOR SIEBEN of Kansas City, Mo., has prepared a new plumbing ordinance. The old law contains some sections which, although good when written, are now said to be objectionable. A meeting of master plumbers took place last week to discuss the new ordinance. The two chief bits of contention were the proposed examination of plumbers as to qualification and outside sewer drains from the basement, with fresh air inlets, instead of a circulation pipe through the roof. It was voted to require the circulation pipe. At present the law requires a fresh air inlet on the soil pipe between the main trap and the house. It is claimed that the extension of a pipe or stack through the roof will vent vapors and stop a nuisance that the old system causes. Another interesting point is that of prohibiting unflushed vaults along the lines of the sewers. Health Officer Wsring contends that the thousands of unflushed vaults are the gravest menace to public health.

LE BLOND-MATTOON PLUMBING COMPANY have been incorporated at Sheboygan, Wis., with a capital of $5000. The incorporators are Sarah Le Blond, E. B. Mattoon and Emma G. Mattoon.

THE MASTER PLUMBERS of Cleveland, Ohio, met last week in the rooms of the Builders' Exchange and listened to the report of Daniel Roberts, chairman of the committee which represented the Cleveland organization at the recent convention of the master plumbers in Cleveland. The master plumbers desire to bring about State and national legislation which will establish uniform rates and methods for plumbing.

THE WHITAKER SUPPLY WORKS, Kokomo, Ind., manufacturers of plumbers' brass goods, have sold out to Henry Goelitz of Chicago, who will immediately double the capacity of the works.

AMONG the new plumbing establishments that have recently been established in Chicago can be mentioned the following: D. G. Monteath, 1558 West Harrison street; Thomas M. Joyce. 32 Pine street; John G. Henzel, 3506 Vincennes avenue; Mark Abrahams, 3456 Cottage Grove avenue; E. F. Anderson, 286 Western avenue; F. P. Gleason & Son, 12 Quincy street; Machalitzky & Loula, 885 Twelfth street; Levy & Son, 4009 State street; Henry Schmidt, 3463 Irving street; Wilson Sanitary Plumbing Company, 3341 State street; William F. Reinmeeth, 4849 Hoyne street

AT A MEETING, last week, of the Shuster Foundry Company, South Pittsburg, Tenn., F. H. Shuster of Philadelphia was elected president, and Joseph Lodge of South Pittsburg, vice-president.

THE CITY COUNCIL of Kokomo, Ind., has taken preliminary steps toward putting in an entirely new system of sewerage during the coming summer, which will provide employment for some hundreds of laborers.

"THE MONSON MAINE SLATE COMPANY" is the title of a neat brown covered pamphlet calling attention to the products of this well-known company, whose Boston office is located at 113 Devonshire street. The first pages give prices, with list of sizes and other particulars, of Monson Maine unfading black roofing slates. Then the company refer to their slate stone products for other purposes, such as urinal stalls, blackboards, wainscoting and capping tile, kitchen sinks, cisterns, laundry tubs, bathroom and vestibule floors, closet seat slabs, register borders, &c. Accompanying the tables are prices and likewise circulars, in which the company give further particulars of these goods.

ARTHUR F. MAYHEW has gone into the plumbing business and opened a shop at 5 Lowell street, Peabody, Mass.

E. T. FORD has opened a steam and hot water heating and plumbing shop at Hanover, N. H.

ROW & BENZ, plumbers, 258 South Ninth street, Reading, Pa., will dissolve partnership, and Mr. Benz will continue the business at the present place. Mr. Row will engage in the same business April 1 at 216 South Ninth street.

IN *The Metal Worker* of March 2 we announced the dissolution of the firm of Hughes & Stephenson of Montreal, Canada, and said that W. A. Stephenson retired from the firm. This may have given the wrong impression that Mr. Stephenson was going out of business. This is not the case, however, for he has leased the premises at 36 Victoria square, corner of Craig street, Montreal, Canada, where under the firm name of W. A. Stephenson & Co. he will carry on a general plumbing, heating, gas fitting, lead burning and electric business. In his announcement he states that he enjoys special facilities for purchasing goods from the leading manufacturers, and has in his employ skillful and practical workmen in the several branches.

N. S. & P. C. STEWARD, plumbers and steam fitters, have leased the Littlefield Building on Elm street, Skowhegan, Maine.

THE CITY COUNCIL of Springfield, Ill., have passed an ordinance providing for the supervision of plumbing and drain laying, for the registration of plumbers and drain layers, to define the powers and duties of city officers and the duties and obligations of registered plumbers and drain layers and to authorize the collection of fees for inspection.

Wade's Plumbing Specialties.

J. J. Wade & Son, 276 Dearborn street, Chicago, have just brought out a fine catalogue of J. J. Wade's plumbing specialties. Mr. Wade is a most progressive and enterprising plumber, with the happy faculty of putting his ideas in practical shape for the benefit of the trade generally. His inventions have been brought out from time to time and quietly placed on the market. They have been known to be quite numerous, but even those most familiar with them will be surprised to learn how wide a field they cover, as shown collectively in this catalogue. The contents begins with the Accessible sewer flushing fittings, the object of which is to make the sewer pipe for house drainage always accessible throughout its length, as well as capable of frequent flushing at traps and other points likely to be fouled. The fittings connected with this system are of great variety, to cover every possible requirement. Then follows the Wade patent sectional flushing iron catch basin, built in sections, which can be bolted together, making a basin of any depth desired. The frequent flushing idea extends to this device also. Next comes the Wade accessible flushing iron catch basin, adapted for boiler blow off, drainage, or for all purposas requiring tight basins. This is supplemented by a sink flushing grease catch basin ejector. Another important improvement is the Wade automatic cellar drainer, for removing water from cellars, excavations, wheel pits, &c., which is operated by water pressure. An illustration is given of the Wade lead burning system, to join the edges of sheet lead or lead pipe so as to resist the action of acids. Next follow lead lined iron ventilation, soil, waste and supply pipe and fittings. The concluding pages illustrate the Wade siphon jet water closet, Centennial pedestal closet, Purity washout closet, Columbian flush rim hopper, Delaware lavatory, Delaware secret waste basin, Delaware plug basin, automatic basin lock valve trap, Delaware lavatory plug basin, Purity basin, &c.

THE PHILADELPHIA STEAM HEATING COMPANY, 1513 Filbert street, Philadelphia, have the contract for placing an extensive steam heating plant in the Real Estate Trust Company's building at 523 Chestnut street. It will cost $6000. They will also put a $2000 plant in the St. Thomas parish school building at Eighteenth and Fernon street.

A FIRE STARTED in a neighboring planing mill destroyed the Baldwin Refrigerator Company's factory, Burlington, Vt., on March 19. The company's loss is reported to be fully covered by insurance.

GROUND has been broken at Tifton, Ga., for a new iron and brass foundry.

ROOFING AND CORNICE.

Berger Bros.,

231 and 237 Arch street, Philadelphia, have just issued what they claim to be the largest catalogue ever published in this country covering a line of tinners' hardware and roofers' supplies, pipe, pipe hooks and fasteners, furnace fittings and kindred goods. The catalogue contains 128 pages of heavy enameled paper, well printed and plentifully illustrated. Following the title page is an introductory announcement to the trade, in which the firm's appreciation of the patronage hitherto extended to them is expressed, as well as their intention to merit its continuance. Page 3 carries the terms under which they do business. The catalogue proper commences on page 4, which page with its follower is devoted to joint gutter. Next in order come miters and roof gutters, quarter circle, O. G. and box gutters. Gutter hangers follow, a large variety being shown. Page 13 and two following pages show Berger's new hinged shanks and circles, on which a patent is being sought. These shanks are claimed to combine great strength and variation, and allow the stems to hang close up to the cornice and the circles close to the shingles; several styles are shown, as well as suitable materials for their application. Trough and gutter hangers and fittings are next shown. Pages 20 to 25 are devoted to corrugated expanding, lock seam and spiral lock seam conductor pipe and fittings, and cast iron header shoes and sewer connections. Two pages are assigned to rain water cutoffs, filtering joints and strainers. Eight handsome designs of conductor heads follow, the designs being now published for the first time. Pipe fasteners and holders of all kinds occupy upward of eight pages. One page shows the B. B. pipe hanger, an entirely new article for use in a great variety of ways, above floor or under ceiling and side walls; it is said to be adjustable to any distance for single or twin pipes and is made in either plain or polished metal. Pages 38 and 39 show expansion bolts, stove bolts and rivets and burrs; and the two following pages cover sundry supplies and tools. Pages 42 to 66 are devoted to a general line of tinners' hardware, including ears, handles, shanks, rings, can screws and bottoms, knobs, stove turn buckles, roof irons and collar clamps; coffee pot and sad iron stands; lifters, lemon squeezer, valves and plungers, and speaking tube and fittings. Considerable space is awarded to sheet iron and zinc, corrugated sheet iron crimp roofing, pressed steel brick and rock face brick siding, roll steel roofing, continuous tin roofing, felt roofings, sheathings, asbestos felt, metallic paints, roofing and furnace cements. Pages 78 to 85 contain furnace fittings of all kinds, dampers being especially prominent. Coal hods, water buckets, stove shovels and pokers occupy two pages. Chimney ventilators and caps take up four pages; then follow galvanized iron ridgings; crestings, cresting blocks and finials are displayed on pages 94 to 111, many new and original designs being shown. Galvanized iron cornices next appear, succeeded by hot air registers. The remainder of the catalogue is devoted to tools and articles of a miscellaneous character. A feature of the book is the number of fine illustrations used, the smallest article being deemed worthy of pictorial representation. The catalogue is bound in stiff paper covers of dark green color, having the firm's name and address on the front, embossed in gold, their lines of goods appearing within a conqueror's wreath, also in gold. The back page bears the firm's well-known trade-mark contained within a scroll. The firm will distribute the issue only to such tinners, tinware manufacturers, roofers, plumbers and architects as apply for them.

FLASHINGS.

Powers & Williams, Streator, Ill., issue an eight-page circular calling attention to the line of goods which they manufacture and sell. The front page shows two styles of galvanized iron vases, while the next four pages show a number of different cornices, the dimensions and prices of which are given. The styles vary from the plainest kind of cornice to quite an elaborate construction. Other goods noted are crestings, skylights, chimney tops, window caps, &c.

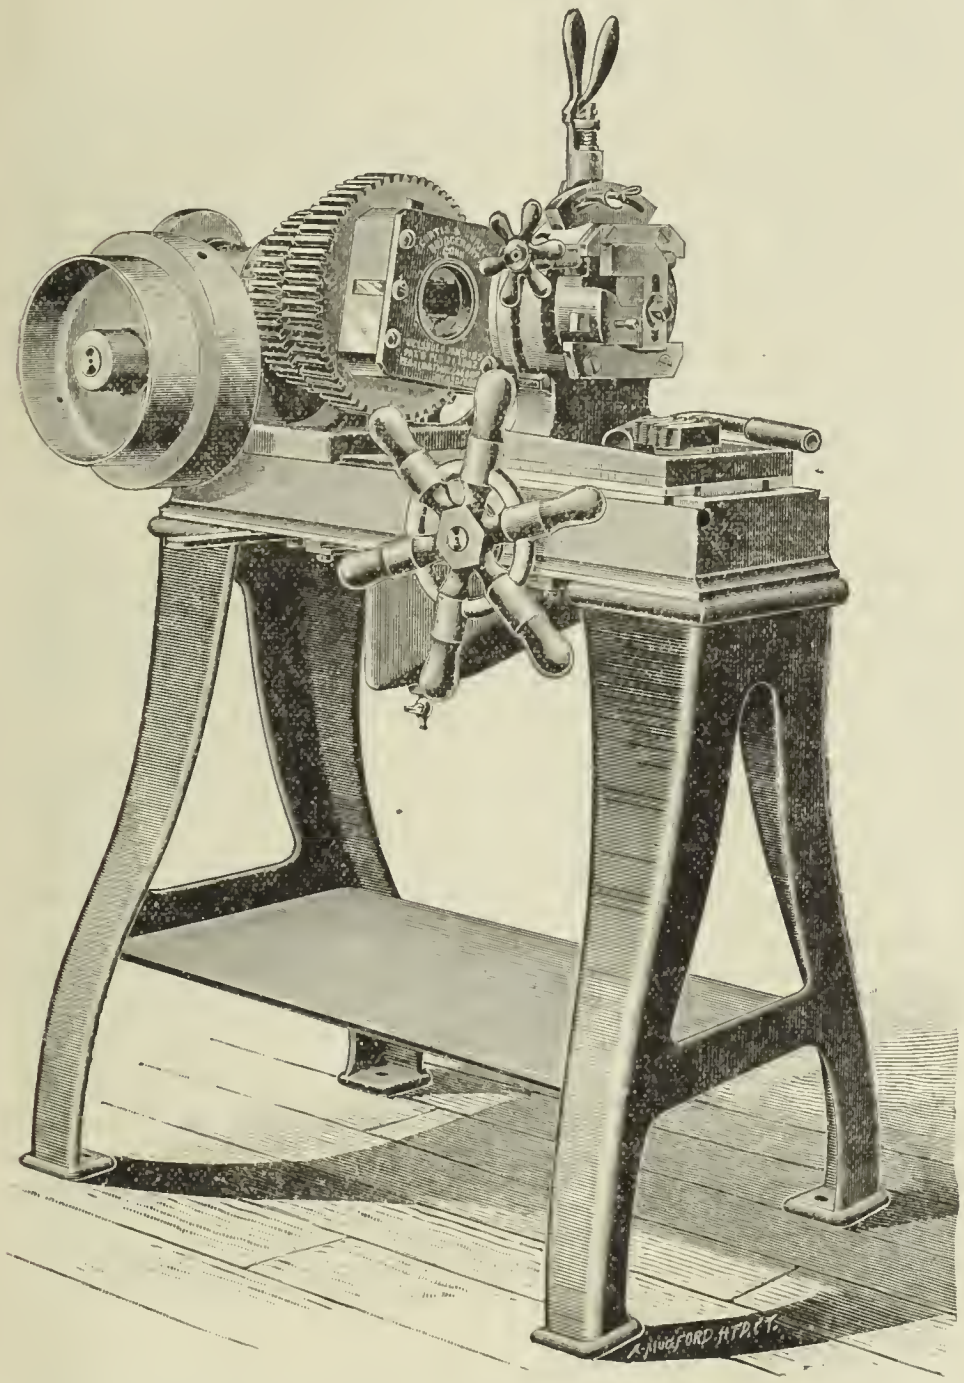
A little memorandum book that will be useful for vest pocket purposes is issued by the Burdick Mfg. Company, manufacturers of roofing, cornices and skylights, who are located at 312–314 John avenue, West Superior, Wis. At the top of the blank pages are printed references to their business.

John Severding, Richmond, Ind., is making a new strap eave trough hanger which he commends to the trade. The hanger is very simple in design, and it is especially mentioned that it utilizes the narrow strips of galvanized iron and tin that have heretofore been thrown into the dump. The features of this new hanger are that it is particularly strong and substantial, being made of No. 15 hoop iron and wide strips. The cross bar is $\frac{7}{8}$ inch wide and a $\frac{1}{4}$-inch strap goes around the gutter. The upright on the roof strap is $\frac{5}{8}$ inch wide, while a $\frac{1}{4}$-inch strip goes through a slot at one end and is fastened with a rivet, and for this strip the galvanized iron or tin scraps are utilized.

Landell & Skelton is the name of a new firm at Fayetteville, Ark., organized to deal in roofing and cornice materials, &c.

The Wheeling Corrugating Company, Wheeling, W. Va., have just issued their catalogue D 169. It is a volume of convenient size, handsomely published, bound in dark blue heavy paper, and contains 112 pages. In an introductory note, referring to the quality of their product, they state that their corrugated sheets are made from the best quality of iron, while their rolled roofings are made from the best quality of steel, their pressed standing seam and V-crimped roofings being made of semi-steel. They state that they will not fill orders for this roofing of common iron, as it will not give satisfaction to their customers. The first goods noted are corrugated sheets. Illustrations are presented showing the style and size of the corrugations, and a few pages are devoted to directions for applying corrugated roofing to wooden framing. A variety of other corrugated sheets are shown. A new feature of the present catalogue is the steel roll and cap roofing with protected cleats, which is illustrated by a section of a roof showing the method of applying the sheets and their appearance when laid. With this are full particulars telling how to apply the roofing. Similarly steel roll and cap roofing with galvanized or outside cleats is illustrated and described. These are followed by other styles of roofing, pressed standing seam, V-crimped, &c. Among new goods are steel rock faced brick siding and steel stone siding, of which illustrations are shown. A few pages are devoted to their tin plates, of which they give a list of brands, sizes, &c. In the section devoted to conductor pipes there is shown corrugated square expanded conductor pipe made in 10-foot lengths, in addition to the others previously illustrated. Among the miscellaneous goods of interest to the roofing trade is the Rainbow rain water cut off, which is described as the best cut off made. Following these are shutters, eave troughs, hangers, &c. A new chapter in the catalogue of the Wheeling Corrugating Company is devoted to malleable crestings and finials, of which many pleasing designs are shown. Galvanized cresting blocks, hip caps, finials and vanes are likewise illustrated, the whole covering over 20 pages. Skylights with frames of galvanized steel or copper are illustrated, and a number of sections of crown moldings and raised moldings are presented. Following a section on cornices and miscellaneous goods comes a chapter devoted to their patent continuous steel ceilings and side wall finish, of which some new and very handsome designs are shown. At the end of the volume is an alphabetical index.

We are advised that the Old Bangor Company of Bethlehem, Pa., have joined the new organization, known as the Bangor Roofing Slate Manufacturers' Association, to which reference was made in our issue of last week. Thus all the manufacturers of genuine Bangor roofing slate are now united, and the maintenance of a uniform scale of prices in the trade will be secured.



The plant of W. H. Mullins, Salem, Ohio, manufacturer of sheet metal and statuary work, is being equipped to burn oil by the system of the Thurman Fuel Oil Burner Company of Indianapolis, Ind. The furnaces, which will be used to anneal copper and zinc and to melt lead and zinc, will be 50 x 11 feet in size. Waste heat from the melting pots will heat the copper and annealing furnaces.

THE LATEST souvenir that has been issued by Gummey, Spering & Co., Philadelphia, is a most serviceable rule, and one that will be most appreciated by architects, for whom it is specially intended. The rule, of celluloid, is 12 inches long, folded in the middle. The advertisement is very simple and merely calls attention to Pennsyl Old Method, described as the finest quality of American roofing tin, and the Alderly brand is spoken of as a very choice quality of heavy coated roofing tin. The rule, which as mentioned is particularly for architects' use, is divided into 12 inches and along each edge the divisions are made for different scales. On one edge is the $\frac{3}{4}$ inch to the foot scale, together with the ordinary even scale of 12 inches. On the other edge are two scales, one $\frac{1}{8}$ inch to the foot and the other $\frac{1}{4}$ inch to the foot. These are the common scales in use, and the rule is so plainly marked that its usefulness will be apparent to every one who is the fortunate obtainer of one.

A circular has been issued by the Scottish Iron and Steel Workers' executive to all trades unions in Great Britain connected with this industry suggesting that a conference of delegates should be called within the next three months to consider the question of home and foreign competition in the iron and steel trades, with a view to devising measures for the maintenance and stiffening of prices.

No. 20 Power Pipe Machine.

To meet a demand for a machine in which when the pipe revolves the dies are stationary, Curtis & Curtis, Bridgeport, Conn., have designed and placed on the market the machine herewith illustrated. A special feature to which the manufacturers allude is that all parts are made interchangeable so that duplicates can be readily secured. The gears are all cut from the solid block, and all working parts, it is stated, are finely finished to gauge. To operate the machine, the pipe to be cut off or threaded is run through the hollow spindle of the machine from the left, passing through the self-centering gulde chuck shown at the left of the spindle and the self-centering vise at the right, and the die head. The pipe is then clamped by turning the screw in the vise, which not only clamps the pipe, but brings it central with the dies; by turning the hand wheel shown on the front of the machine the die head is moved so that the cut off tool comes opposite the point on the pipe where it is desired to cut, and can there be clamped in position. The back stop shown on the right side of the die head is run down over the pipe, and the pipe cut off by turning the wheel on the side of the die head. All this cut off arrangement is self-contained and allows a movement within ways, so that if the pipe should be slightly bent or out of round it would move with it, and thus facilitate the operation. Should it then be desired to thread this end of the pipe, the lever shown on top of the die head is thrown over to the proper graduation on top of the machine, which brings the dies to the standard size for the size of pipe to be cut. Should there be found that the fittings to be used varied from the standard, the proper allowance can be made with this lever so as to cut over or under standard size. Should there be a number of pieces of the same size to be cut, as in making nipples, the block into which the lever engages can be set to size and the lever simply snapped back into it each time without resetting. This feature is of particular value where the machine is operated in a dark room or where unskilled labor is employed. The die-carrying head is then advanced by turning the hand wheel shown on the front of the machine, operated through a rack and pinion under the die head, and the dies lead on to the pipe. When the dies have advanced as far as desired the top lever is thrown back, which frees the dies from the pipe, the die head is drawn back and the pipe is removed without running back over the thread. This machine is arranged with two sets of gearing for rotating the spindle and pipe, each of which is adapted to give a different speed to the machine. A change of speed from one to the other is obtained by simply moving a convenient lever while the machine is running at full speed and without being obliged to stop. This feature, it is said, will be found of special value in changing from threading to cutting for where a higher speed is desirable. With a change of belt speed on the cone four speeds of machine are obtained. When desired the machine is fitted with a hand wheel which is attachable to the cone shaft, thus allowing the machine to be operated by hand power. Solid pipe or bolt dies can be used with this machine when desired.

No. 20 Power Pipe Machine.

United States Consul Bruhl, at Catania, Sicily, suggests to the State Department what he considers may be a good opening for American trade in that island. It is for the building of small frame houses of from three to five rooms, such as we usually term cottages, which can be shipped from this country for eventual erection in Sicily. Mr. Bruhl is led to the belief that this industry could be established and carried on profitably from the fact that in that country the frequent earthquakes damage and destroy the houses erected there, the builders not being sufficiently advanced in the building art to be able to meet the demands in their construction. Relying on the superior facilities of the American builder and the workmanship that would be used, the consul is convinced that the people there would readily adopt the American structures, as better calculated to resist the frequent shocks. He has interested himself in the subject to a considerable extent, and is anxious to obtain illustrated catalogues and other information from American manufacturers and builders to lay before the Royal Earthquake Commission, with a view to having the experiment tried.

TIN PLATES.

The Proposed Restriction of Welsh Tin Plate Production.

The close of the present month promises to prove a period of critical importance in the Welsh tin plate trade. On March 31 expires the term of the arrangement whereby the men at a number of the works in South Wales agreed to accept a temporary reduction of wages, averaging about 12½ per cent. When this agreement was arrived at the manufacturers were in hopes that an improvement in business might occur in the interval and that prices might advance to a more profitable level. Neither of these expectations has been realized. Business has, if anything, declined in volume, mainly on account of the slackness in the demand for tin plates from this country, and prices have dropped from 3 pence to 6 pence a box. Consequently the makers are in an even worse position than they were at the opening of the year, and are now in no condition to restore the old wage scale. The men on the other hand seem disinclined to a continuance of the present scale of payment unless their working time is reduced. According to the latest advices from the other side, the two interests are endeavoring to agree on a compromise. But the obstacles to any arrangement which will be agreeable to both the employers and the Tin Platers' Union are said to be considerable.

It seems to be generally conceded that a restriction of output is imperative. Judging by the business done last year, the productive capacity of the active Welsh works, even if limited to 36 boxes a turn per mill, exceeds the present average demand to the extent of about 100,000 boxes a week. This represents the surplus production which, accumulating, gluts the market and causes constantly falling prices. To avoid this evil, the newly formed Board of Control in the tin plate trade, composed of a number of the leading manufacturers, has suggested that in order to assimilate the make to the demand, production should, after March 31, be reduced one-third of the capacity throughout the entire number of mills. To make this rule effective it is proposed that every third week should be a "stop week."

This proposition has received the approval of a large number of the makers and, in principle, is favorably considered by the union. The main obstacle, however, to its general acceptance lies in the fact that the manufacturers who are most strongly pushing the plan happen to be those who at one time or another have been connected with tin plate ventures in the United States, and an impression has got abroad among many of the makers as well as the men, that these persons are not working for the best interests of the Welsh trade. As, however, nearly all of them are stated to be no longer financially connected with the American industry, the prejudice seems to be somewhat unreasonable; still, it exists, and as Welshmen are notoriously tenacious of a once formed notion, the impression is regarded as likely to operate against harmonious action on this line.

The executive of the Tin Platers' Union have meanwhile issued a manifesto to the tin plate workers of South Wales, Monmouthshire and Gloucestershire, in which they approve the plan for the proposed assimilation of supply to demand by the stoppage of one-third of the capacity throughout the trade provided the men divide the work. "Employers of standing," runs the circular, "agree that this is practicable, and further contend that the action proposed will have the effect of advancing prices, and while we will be no party to secure artificial prices, which may encourage American competition, we submit that it is as much your duty to help employers to get fair prices as it is for yourselves a living wage. We welcome the assistance of employers and trust that few will be found so inhuman as to oppose this solution of our unemployed difficulty and their folly of having to sell plates under cost; but we wish to make it clear that our hopes and reliance rest upon tin platers realiz'ng in due time their best and truest interests. Wage reduction agreements terminate at the end of March. You will be tempted to extend these arrangements. We ask you on no condition to do so unless your employers contract with you to permit two-thirds time being worked. If a successful stand is thus made, in all likelihood the standard wage rate will be yours within a short time and you will agree that to work six hours' shift with a full wage-rate is better than working eight hours' shift with 12½ per cent. reduction. . . . Your executive in this way opens a course before you, which, if followed with the determination and enthusiasm characteristic of tin platers, will aid in removing misery and suffering, restore uniformity of conditions and do away with that mad competition destructive to the employer and intolerable to the tin plate workman."

A further conference between the manufacturers, represented by the Board of Control and the representatives of the union, is to take place, it is understood, before the end of this month, when strong efforts will be made to arrive at a basis of agreement. Want of sympathy with promoters of the present movement on the part of a large number of people in the trade is thought, however, to be adverse to any effective joint action. A strong party is said to be still desirous of raising the price of plates to a basis of 10 shillings and 6 pence or 11 shillings a box, while others again propose that by mutual concessions on the part of employers and employed, the former contenting themselves with no profit and the latter accepting a further substantial reduction in wages for a fixed period, the price of plates might be reduced so low as to practically kill American competition. Both these schemes are regarded, however, as unworkable in effect, and except for the prejudice in regard to its source, before mentioned, the proposition offered by the Board of Control seems to be the only one that would command the assent of a majority of the makers and workmen.

SCRAP.

Two of the black plate mills recently built by Ætna-Standard Iron & Steel Company, Bridgeport, Ohio, have been put in operation, the first black plates for tinning having been rolled on Thursday morning, the 14th inst. Two others are about ready, and are expected to be rolling black plates within the next two weeks.

The Whitaker Iron Company, Wheeling, W. Va., have started up four sheet mills which have been idle for the past six or eight weeks. Two other sheet mills in this plant, which have been working right along, have been closed down.

The tinning department of Meurer Bros. Company's works, 575–577 Flushing avenue, Brooklyn, which has been closed down for alterations and repairs, will start again into full operation on Monday. Messrs. Meurer report a good demand for their various brands of American tin and terne plates.

The machinery has all been received and is now being placed for the new works of the National Tin Plate Company, North Anderson, Ind. It is announced that the works will be in operation by May 1. When completed they will employ some 750 men.

The Anderson Foundry & Machine Works, Anderson, Ind., shipped last week three carloads of tin plate machinery to the new plant of the Monongahela Tin Plate Company, Pittsburgh, and one carload to that of the Great Western Tin Plate Company, Joliet, Ill.

The tin plate plant of the La Belle Iron Works, Wheeling, W. Va., is fast approaching completion. The machinery is being installed, and it is expected that the works will be in operation by May 1.

The Board of Trade, Beaver Falls, Pa., has succeeded in raising nearly the whole of the $20,000 bonus for a new tin plate mill, which it is proposed to locate at that place.

The Washington Improvement Company of Washington, Pa., a concern who have been organized and chartered for the purpose of promoting the location of industries at that place, have, it is said, practically closed arrangements for the establishment there of a large tin plate mill.

Wheeling Corrugating Company, Wheeling, W. Va., have started up a couple of stacks in their new tinning plant. The company purpose making both charcoal and bright tin, as well as roofing plates. According to their latest catalogue, just issued, the firm are making two brands of high grade hand redipped ternes, the Margaret and the Nelson, and two brands of rolled, full coated roofing plates, Elea-

nor and Wylie; besides three grades of bright charcoal and one brand of coke plates. They are also manufacturing and offering to the trade continuous roofing plates in their various brands, as well as flat seam tin roofing and tin valleys and gutters. In this manner they expect to consume a part of the output of their tin plate department themselves. The agent of the Wheeling Corrugating Company in New York City is H. C. Mechling, 81 and 83 Fulton street. They have also branch offices at Chicago and St. Louis.

F. A. VINAL, dealer in tin plate, sheet iron and metals at 124 Purchase street, Boston, Mass., has recently begun importing two special brands of terne plates, namely, Allston and Gem, which he is offering to the trade of New England.

THE FAMOUS Botallock tin mine in Cornwall, after being worked for over 200 years, is about to be closed, either permanently or until times are better, as it does not now pay to operate it. The Botallock is one of the most famous and frequently visited mines in the world on account of its picturesque situation near the wild Cornish coast and the remarkable engineering features connected with it.

THE MEN employed in the black plate mills of the Monongahela Tin Plate Company, at Pittsburgh, have been organized into the Amalgamated Association.

THE BRITISH BOARD OF TRADE returns for February show a large falling off in the shipment to the United States of black plates for tinning. They were only 451 tons, as against 2277 tons in the previous month. This is probably due to the large increase in the number of American mills producing these sheets which have come into operation since the beginning of the year.

GUMMEY, SPERING & Co., Philadelphia, advise us that they have not shut down their tin plate plant a single working day during the past quarter, such has been the demand for their brands of American tin and terne plates, many of which have become well known and appreciated among consumers. They call attention to a new brand of best bright coke plate, Champion, which they are now offering to the trade.

AMERICAN SHEET IRON COMPANY, Phillipsburg, N. J., are arranging for the addition to their plant of a second black plate mill.

Salt Lake Supplied with Natural Gas.

Salt Lake, Utah, is rejoicing over the final arrival of natural gas, which has been piped from the wells 14 miles distant. The completion of the first connection was celebrated by the illuminating of the main streets with flambeaux turned on at high pressure from the mains at the Temple Block. The supply is brought to the city by an English company and will be connected with the mains of the local gas company, who have contracted to supply a number of large local manufacturers and city consumers at a price low enough to displace coal as a fuel. The wells already improved have an aggregate output of 20,000,000 feet per day. The supply already available is ample for the entire demands of the city for domestic light and heat, with a good surplus for manufacturing purposes.

Capital and Confidence.

In business circles the one achievement which is devoutly hoped for, says *The Iron Age*, is a restoration of confidence. We find that a good many merchants and manufacturers interpret that phrase as a recovery of sufficient nerve among buyers to place more liberal orders, for more extended delivery. We believe that a deeper search will reveal that a sense of security on the part of capital is the most important influence bearing upon it. If that be true, then it needs much to overcome the disastrous effects of the developments of the past two years and the influence of current contentions. A review of recent industrial and commercial history appears to show that success could not have been more complete if the deliberate aim had been to frighten moneyed men into inactivity. Capital is proverbially timid, although it has its spells of reckless courage.

Whatever may be the merits of the questions involved in the great battle of the standards, this one fact will be hardly disputed, that the great majority of moneyed men are either uncompromising "gold bugs" or believe in bimetallism only when it is backed by the unqualified support of all civilized nations. So long as such men see before them the danger that power may pass into the hands of legislators representing what to them are crazy views, capitalists will keep their money idle.

It is curious that the same men who will resort to cajolery and to every means of persuasion to win the confidence and good will of capital when they want it for their own individual use and profit, believe that the best instrument of conviction against capital collectively is the club. The same men who rush to financial centers to secure money for the development of the resources of their native States and Territories at home make ringing speeches against the Shylocks. They recognize the power of money and yet attempt to overawe and domineer capital.

When business men, who ought to know better, resort to such bulldozing tactics, it is not surprising that workmen, piloted by their walking delegates, do the very acts which must prolong the sufferings against which they rebel. Every unreasonable strike, every act of violence, discourages enterprise and drives into the financial centers money, the employment of which would mean work for the idle and the needy. So long as no power exists to force capital into the channels of industry injustice and violence on the part of those who work for their daily bread must react upon them.

There is another very serious cause for the timidity of capital, be it foreign or American, which should be frankly exposed, and that has been the laxity of business principles which has widely prevailed. The course of the managers of some of our great railroad systems now in the hands of receivers has been outrageous. The deliberate falsehoods uttered on the eve of failure have shocked that large class of security holders who may pardon a loss but never forget deception. The stock-jobbing on the part of officials, the juggling with accounts and the manipulation of corporate interests for private gain are scandals which have discouraged the flow of money into channels into which they went freely for many decades.

Revival can only come when conservative capital has become convinced that the lesson of the past few years has been thoroughly learned. A speculative spirit can only develop after continued moderate successes have made the timid venturesome. The vast majority of the born speculators and boomers have nothing but the memory of past financial greatness left to them. The men of large means and solid wealth will be the first to seize the many opportunities for successful operations. But they, too, are the most cool headed, the ones who can afford to wait patiently, the ones who cannot be bulldozed, but must be convinced by clear evidence that irresponsible and dishonest attacks upon capital have ceased.

Furnace Fittings.

The Excelsior Steel Furnace Company, 38 West Monroe street, Chicago, have made an important reduction in their price of Furnace Fittings. They are enabled to do this by the lower cost of material, thus giving their customers the benefit of the decline which has taken place since last season. They are now quoting 50 and 10 % discount on the old list, and in addition allow full freight to points east of Omaha and Kansas City on orders of $10 or over, provided payment is made within 30 days by remittance in New York or Chicago exchange, accompanied by railroad expense bill. No charge for cartage or crating on such orders. Orders of less than $10 subject to charge of 50¢ for cartage and crating; 2 % extra allowed on bills paid in 10 days. Equally important reductions have been made on their entire line.

The late G. T. Simonds of Fitchburg, Mass., gave the last years of his life to the development of ball bearings. An English company are bringing out his patents abroad. Among them is one to which Mr. Simonds attached much value, and that is the method for hardening the balls after they had been rolled. The object to be hardened is plunged first into brine and afterward into oil. This by itself is not new; but the novelty consists in the manner in which it is done. It is desirable that the object to be hardened should remain for a certain number of seconds in each of these fluids, and that it should pass from one to the other without coming in contact with the air. This is effected by making the bath double, the partition in the middle not extending quite to the bottom. It is then half filled with brine, on the top of which oil is poured on one side only. An endless chain fitted with wire buckets enters the brine at one side of the bath, and passing under the partition, comes out through the oil. The rate at which this chain is driven being decided and the depth of brine and oil regulated accordingly, it is evident that the objects in the wire buckets will remain immersed the exact time required.

THE WINDOW GLASS manufacturers from all over the United States met this week in Pittsburgh and formed a pool to be known as the National Association of Window Glass Manufacturers, whereby they will regulate prices and place the industry on a more profitable basis. The Indiana manufacturers after the general meeting met and advanced prices from 10 to 15 per cent. This action will, it is said, be made general shortly.

STOVE TRADE NOTES.

The Ohio Stove Trade.

Reports from stove manufacturers, in the main, are encouraging, but they are not uniform. A few producers are in the slough of despondency, judging from the tone of their communications, but these advices are from a small section, where the general improvement, so noticeable in other terrltory, has not been felt. Throughout Ohio and many parts of Indiana, however, come most encouraging reports, the first quarter of the year 1895 showing an increase of 50 per cent. in sales over the corresponding time a year ago, and even comparing favorably with the trade of two and three years ago. One manufacturer writes that business in stoves has been double that of a year ago, and, further, that his company are booking more orders for future delivery than ever before.

But while there is little room to doubt that the volume of business is increasing, it is equally true that profits are not increasing in the same proportion, but this cannot be expected by thoughtful business men.

Not a few stove founders have been farsighted enough to cover probable needs for pig iron by purchasing supplies for delivery during the next few months, thus protecting themselves against any advance in prices which the present buying movement of pig iron may create. Up to the present tlme, however, the pig market has been in favor of consumers, and the advance anticipated by furnaces has not been realized, but the indications at the moment are certainly for a hardening market.

Industries other than stove foundries dependent largely upon iron in this section are improving decidedly, and the activity previously noted in the money market continues. Loans of the Cincinnati banks have been expanded over $1,500,000 during the first quarter of 1895, while deposits have increased only about $500,000, and now country banks are drawing upon their balances quite heavily, and in addition are borrowing funds, indicating activity in the rural districts.

THE SYRACUSE STOVE WORKS, Syracuse, N. Y., have in the Kernan Welcome range a very attractive six-hole stove, which embodies the results of years of experience both as regards ornamentation and constructive features. The range has large fire box so arranged that the grate pulls out through the front opening without disturbing the water back or brick, capacious oven and Duplex Dockash or plain flat grates, as may be desired. The sheet flue is of good size and the stove is guaranteed a quick baker and worker. The hot air for the upper rooms is drawn from the base and rear of the range without interfering with the water back or baking qualities. The Kernan Welcome is offered in two sizes, portable form and brick set.

Settlement of the Trouble at the Southern Stove Works.

The differences existing for some time past between the workmen and the management of the Southern Stove Works, at Evansville, Ind., have been adjusted and it is expected that matters will now run along to the satisfaction of all concerned. A brief account of the trouble and the settlement is contained in the issue for March 10 of the Evansville *Courier*, being an interview with August Brentano of the firm of Kiechle, Brentano & Oberdorfer, proprietors of the Southern Stove Works. In this interview Mr. Brentano says:

The firm closed their works in December, as they usually do for some time during that season. Early in January many of the employees went to Mr. Brentano and desired him to commence work again. He then called together 30 of his most skilled workmen and said: "Now, you can all go to work if you will not interfere with other men who make all kinds of stoves." They agreed not to and we commenced operation again. After we had been working for about two weeks we received an order for a Franklin stove from New Mexico. Several pieces were missing and the foreman gave orders to have them made. As soon as the workmen commenced work on them the 30 men stepped up to him and told him he must desist. There's where the difference originated. In the first place, there was no walk out; there was no lock out; there was no strike. All but 11 of the molders that were working for us were discharged by the foreman of the molding department, through the firm, for not obeying orders in regard to the discharge of some work they were told to do.

It appears that there is a certain make of stove called the Franklin that is termed a "strike" job when union men are forced to work on it. On Saturday, when the men were asked to commence work on that make of stove, there was wrangling at once. Some said they would quit that night—in fact, all but 25 said they positively refused to obey the orders of the foreman. On the following Monday all of the men reported at the molding room for duty. The question was again asked them if they would work on the stove and all but 11 refused. The foreman at once told those who would not follow instructions to take their tools and leave the premises at once, which they did.

My next action was then to advertise for non-union molders. They soon came from all over the country. The union men living here captured them, however, on their arrlval, and after intimidating them paid their way out of town again. I finally had quite a large number of molders together, however.

In the mean time the union men were continually harassing the 11 union men in our employ and their families also. They even went so far as to "do them up" and scared their families. The men were true to me as long as they could be, and then for fear of their welfare and their wives and children they went out also. I desire to say right here that those men are still in possession of their union cards and will go to work for me on Monday morning.

I finally had nothing but non-union men. This continued so until Monday of this week.

On Monday G. F. Valentine of San Francisco, Cal., vice-president of the International Molders' Union of North America, came to me and introduced himself and related to me his official posltion, and asked for an interview. It was granted.

At the interview he asked me if the matter could not be arbltrated. I told him the firm were tired of the unfairness shown them by the local unlon; that this trouble had been continuous for the past seven years. We have adhered to the local union as close or closer than any manufacturer here, and we have had the most trouble and we are tired of it—thoroughly disgusted with being dictated to by our employees. However, I found Mr. Valentine a courteous gentleman, and it was not as difficult as I at first supposed lt would be to adjust our differences.

The matter is now settled to the firm's satisfaction in every detail. You may say in your valuable paper that the firm are in far better condition in regard to our rights and privileges in our works than we were before the strike occurred. We now know what we are doing. Heretofore our employees run our business, and hereafter we will run it ourselves and to suit our own fancy and in accordance with the new management.

You might add that we will have nothing to do whatever with the local union. Our contract is made solely and directly with the International Molders' Union of North America.

You can say in your paper that the firm's boarding house at the manufactory was closed Friday night, and that the union men have paid all the non-union men's transportation out of the clty or taken them into the union.

The union force will work for us, commencing Monday morning. I engaged 50 molders to-day, including the 11 who stood by me in time of need. There is no reason why these men should not continue their work, as Mr. Valentine admitted to me that the men, our employees, alone were in the wrong.

We have gained a decided vlctory, and our firm are thoroughly satisfied with the present arrangements.

STOVE MANUFACTURERS who have pattern making departments of their own will probably be interested in a new rotary wood trimmer which the Hess Trimmer Company, Twenty-fifth and Callowhill streets, Philadelphia, are

putting on the market. It is said to trim very wide work, accommodate material as thin as $\frac{1}{64}$ incb, and to possess numerous other advantages. The company have published a circular explaining the machine in detail.

S. M. Howes.

The New England stove trade recently lost a valued member in the death of S. M. Howes, which occurred Sunday, March 10, after a lingering illness, at Rockland, Mass. Mr. Howes was a native of Dennis, and while a young man went to Methuen, where he learned the tinsmith trade. In 1872 he established himself in the stove and tinware business in Rockland, where he continued for seven years. He then engaged in business in the city of Boston, and for a period of 15 years was at the head of the S. M. Howes Company, well known to the trade of the country, and especially throughout the New England States, as wholesale dealers in stoves and heating apparatus. A fully attended meeting of the Wholesale Stove Dealers' Association of Boston was held on the afternoon of Monday, March 11, at the office of the Walker & Pratt Mfg. Company, Boston, to take action upon the death of Mr. Howes. A Committee on Memorial Resolutions was appointed, as well as a committee to attend the funeral at Rockland on the afternoon of Tuesday, March 12. Mr. Howes was born 44 years ago. A widow and three children survive him. The funeral services were conducted by Rev. A. L. Wadsworth of the Baptist Church, music being rendered by a quartette. The remains were taken to Abingdon, where they were interred in the Mount Vernon Cemetery. Among those in attendance at the funeral were the directors of the Rockland National Bank, trustees of the Rockland Savings Bank and the committee from the Wholesale Stove Dealers' Association of Boston. Out of respect to the memory of Mr. Howes all the stove and hardware stores on Union street, Boston, were closed between two and three o'clock on the afternoon of the funeral.

The Manufacture of Furnaces in Syracuse.

We have received from E. C. Moses, assistant secretary of the J. F. Pease Furnace Company, Syracuse, N. Y., a letter in which he makes reference to the article printed in a recent issue of *The Metal Worker* respecting the manufacture and sale of furnaces in this State. Mr. Moses' letter, which explains itself, we present in full below:

Our attention has been called to the statement made on page 49 of *The Metal Worker* of March 9 in an article written by William H. Landers of this city, on "The Manufacture and Sale of Warm Air Furnaces in New York State." The statements refer to a comparison of the production of warm air furnaces in the several cities of the State of New York. Syracuse is set down as producing 2500 in an average year; Utica 8000, &c. As the estimate is preceded by the statement in which the writer says that it is made merely from observation, we do not suppose the comparison should be taken seriously by those who understand and know the relative production of the two cities. However, to correct an impression which may have been gained from the article and to set Mr. Landers right, we would state that Syracuse produced in 1890, or in any subsequent year, far more than 2500 furnaces; in fact, the J.F. Pesse Furnace Company alone have produced far more than that number. We think it would not be overestimating this city's production to state that fully 5000 furnaces are easily manufactured annually. There are, we believe, six or seven wide-awake manufacturers in Utica, and it is quite probable that they produce together from 5000 to 8000 furnaces. There are only three manufacturing concerns of this character in Syracuse. These three concerns are by no means insignificant in the production of furnaces. If the statement referred to heating apparatus in general we would, witb the help of our house heating boiler manufacturers of this city, roll up some figures which would be interesting if not preponderating.

Cupola Tuyeres.*—VI.

BY DR. EDWARD KIRK.

Number of Tuyeres.

A cupola may be supplied with blast from one tuyere placed on one side of the cupola, but the objection to one tuyere arranged in this way is that the heat is driven by the blast against the opposite side of the cupola, and the destruction of lining at this point is very great. For this reason, at least two tuyeres are always placed in a cupola, and they are located on opposite sides so that the blast will meet in the center and be diffused through the stock. When a greater number of tuyeres than two are placed in a cupola they are located opposite each other and at equal distances apart to admit an equal amount of blast on all sides and prevent an uneven destruction of lining from the heat being forced unevenly against it by the blast. Any number of tuyeres desired may be placed in a cupola, and as high as 100 have been used in a 40-inch cupalo and a greater number in larger cupolas. But these large numbers have given no better results in melting than two or four tuyeres in the same cupolas. It is not necessary to place a large number of small tuyeres in a cupola to distribute the blast evenly to the bed, and it is not advisable to put in small tuyeres, which are easily closed by the fuel, cinder and iron, and are oftener rendered useless than large ones. Better results are obtained from large tuyeres and fewer of them.

The largest cupola in use may be supplied with blast by two tuyeres if they are big enough. The large cupola of the Buffalo School Furniture Company, Buffalo, N. Y., is supplied with blast by two tuyeres 12 x 18 inches, placed on opposite sides. This cupola, which is 60 inches in diameter inside, does excellent melting with only these two tuyeres, and the destruction of lining in melting is very light. I saw a large cupola with two tuyeres of about the above dimensions in use in a stove foundry in St. Louis, Mo., about 20 years ago, and it did excellent melting. The results obtained from these two cupolas would go to show that there is nothing gained in distributing the blast to the bed evenly by a large number of small tuyeres. When a number of tuyeres are placed in one row every other tuyere is sometimes placed about the width of the tuyeres higher than the tuyeres on either side of it. I have, however, never observed that anything was gained in melting by placing tuyeres in this way. When a double row of tuyeres is used the upper row should be made very small in comparison with the lower row, for if they are made of the same size as the lower row, or even half the size, and the two rows are placed at any great distance apart the heat is so concentrated upon the lining between them that it may be burned out to the casing in one or two heats. Foundrymen using the double tuyeres, who find the destruction of lining very great, may prevent it to some extent by reducing the size of the upper tuyeres.

*Copyrighted, 1894, by Edward Kirk.

Shape of Tuyeres.

The shape of a tuyere has nothing to do with the melting, except as it may tend to prevent bridging or increase the depth of the melting zone by supplying blast to the fuel at different hights in a cupola. A small horizontal slot tuyere extending around a cupola, or the greater part of the way around it, tends to promote bridging, and it is generally conceded that a cupola with a tuyere of this kind cannot be run for a greater length of time than two hours without bridging and clogging up. Vertical slot and reducing tuyeres supply blast to the bed at different levels and increase the depth of the melting zone the same as the double tuyere. For this purpose the Truesdale, Lawrence or triangular tuyere, with elongated sides, are excellent tuyeres when made of a proper size and placed a proper distance apart. When it is not desired to admit the blast to the bed at different levels the flat or oval tuyeres are generally considered the best shapes, for they admit the blast freely, and a less amount of fuel is required for a bed with these shapes than with a round or square tuyere of the same area.

Tuyeres to Improve the Quality of Iron.

All kinds of fancy shaped tuyeres have been placed in cupolas to improve or change the quality of iron in melting; they have been placed to point up, point down, point across each other at certain angles and to point to the center of the cupola. There is nothing more absurd than to attempt to improve the quality of iron in a cupola by the shape or angle of the tuyeres. The instant the blast leaves the mouth of a tuyere it strikes the fuel in front of it. The shape or angle given to it by the tuyere is then instantly changed, and it passes through the crevices in the fuel until its oxygen enters into combination with the carbon of the fuel and produces combustion; it then escapes at the top of the melting zone, where it comes in contact with the iron as carbonic acid gas. This is the result, no matter what the shape or angle of the tuyeres, if a proper amount of blast is supplied. It may be claimed that the blast acts upon the iron as it drops through the fuel in the bed after being melted, but as before stated, the shape or angle given to the blast by the tuyeres is changed by the fuel, and the effect on the iron of the blast from one tuyere would be the same as from another.

Tuyere Boxes.

The tuyeres may be and are often formed in the lining of a cupola when laying the brick, but this is a very poor way of making tuyeres, for there is nothing to support the brick and maintain the shape of the tuyeres, and they are often broken or burned away until there is no regular shape to the aperture, and it is difficult to put the blast into the cupola at the point desired or to prevent iron or slag getting into the tuyere. Tuyeres are more generally

formed with a cast iron lining or tuyere box, having the shape and size of tuyere desired. This box may be cast with a flange on one end and be bolted to the casing, or it may be cast without a flange and placed in the lining at the desired point as it is laid up. They are made in both ways, but it is better to cast it with a flange and bolt it to the casing, making an sir tight joint, as it then insures the blast going directly into the cupola at the point desired. Tuyere boxes laid in a lining answer the purpose very well when the lining is new, but when it becomes old and shaky, or a section is removed and replaced, the lining often settles and the grouting or filling falls out, leaving crevices through which the blast escapes between the casing and lining, and from there enters the cupola at points where it does no good.

The cold blast supplied to a cupola keeps the tuyere box cool and it is not necessary to cast it hollow and fill it with water to prevent it being melted or injured by the heat. The only part of the box that is exposed and liable to be injured is the end next the fire, and to protect it the box at this point is generally cast about ¼ inch shorter than the thickness of the lining and the end covered with a little clay or daubing.

Selling Gas Stoves.

The season for the dealer to buy a line of gas stoves is here and there is little doubt but that the use of this kind of summer cooking apparatus is on the increase. This fact, however, is not enough to make handling a line of them profitable. They must be displayed both conspicuously and with good taste, and the report of an official of an English company is worthy of consideration on this point. The company had previously paid little attention to display, but finally tried the experiment of a fine showroom. A very handsome department for the sale of gas stoves had been fitted up. It had been a slightly costly enterprise, but they looked upon the outlay in the light of an advertisement to a large extent. Apart from that, although the department had only been opened a very few weeks the sales had amounted to several hundred dollars. It had been shown that a wonderful difference existed between having stoves on view in good airy, handsome premises, where the consumer could go and examine them, see them lighted, and, if satisfied, figuratively take them away (in other words, agreeing to purchase before leaving); and the other style of doing business by which the customer was obliged to go to a small space, where he was shown merely a picture or representation of a stove, and if he made up his mind to have one had to wait to be supplied. When, as in the case of a fine display, he saw a stove that suited him the business transaction followed, and was completed at once.

A LETTER from one of the spokesmen of F. M. Borden & Bro., Philadelphia, states: "Our vocal instructor has trained the boys to shout quality first and then talk price." They are now showing their samples of Challenge Iceberg refrigerators, Reliable gas ranges, Electric and All Right oil cooks, and the New Process, Splendid, Novelty and Globe, Jr., gasoline stoves. Their stove repair department is now located at 122 North Second street, under the management of C. S. Stevens.

ODD PLATES.

THE MISSISSIPPI VALLEY STOVE COMPANY of Fulton, Ill., have been reorganized. It is stated that local capitalists have purchased the interests of the Ohio stockholders. The new Board of Directors consists of J. W. Broadhead, E. Lockheart, Edmund Jackson, H. T. Heller, Jacob Martin and A. L. Van Osdale. The president is J. W. Broadhead; vice-president, H. T. Heller; secretary, A. L. Van Osdale; treasurer, Edmund Jackson. The manager is A. L. Van Osdale and the superintendent is Jacob Martin.

OTTO W. ROPIEQUET, who was appointed the assignee of the Rogers Stove & Foundry Company of Belleville, Ill., has filed in the County Court his bond in the sum of $8000.

WORK has been resumed at the Shakopee Stove Foundry, Minnesota.

THE NEW YORK STOVE WORKS, Peekskill, N. Y., are making a handsome addition to their line of 45 styles and sizes of gas hot plates and special appliances. The new candidate for kitchen favor is a gas range which they call the Surprise and a sample of which is on exhibition at John Savery's Son & Co., 97 Beekman street, New York. The range has three cooking holes on the top, one having a double ring burner, the inner ring giving a small flame for simmering or slow cooking, and when reinforced by the large flame of the outer ring a very powerful burner is available. The range is of the high cabinet type with an oven 12 x 12 x 10 inches high, with a boiler below the oven and the burner arranged to do double duty. All of the burners are provided with a regulator on the air mixer for adjusting the air supply to the gas pressure. In appearance the range is attractive, the design of the castings being neat and embellished by a fine nickel panel and an art tile on the oven door.

THE STOVE DEALERS of Pennsylvania, New Jersey and Delaware are to have a fine variety of gas and gasoline stoves from which to make a selection, says a local observer. J. Elwood Yeager, Philadelphia, who runs the New Era line of stoves, has the Clark's Jewel gas and gasoline stoves. Faith & Co. have the Reliable gasoline stoves and another line of gas stoves. The Philadelphia branch of the Mt. Penn Stove Works are showing the Dangler line of gas and gasoline stoves. J. Geo. Kurtz & Bro, Mahood & Co. and Hansell & Belson also have attractive gas and gasoline goods.

THE MAJESTIC MFG. COMPANY of St. Louis, Mo., last week awarded the contract for the erection of a new factory building which is estimated to cost $75,000. The structure will occupy a lot fronting 108 feet on the south side of Morgan street between Twentieth and Twenty-first streets. This addition to the company's plant has been made necessary by the increase in the demand for steel ranges.

THE VICTOR STOVE COMPANY, with works located at Salem, Ohio, resumed operations on Thursday, March 14.

THE AMERICAN GAS STOVE COMPANY of 615 Ogden avenue, Chicago, Ill., have issued a catalogue and price-list of the gas cooking and heating appliances which they manufacture. The goods are made under the name "American" and are offered in a variety of styles and sizes. In the ranges the bodies, ovens and broilers are constructed of heavy cold rolled refined steel, the oven having a double bottom consisting of an extra heavy steel plate. The oven has the makers' patent automatically balanced drop door with cold handle. The broiler contains broiler pan and wire broiler grate, and there is a galvanized drip pan under the top burners. There are pilot cocks at the oven and water heater burners. The statement is made that three single and one double top cooking burners are used on all four-hole ranges, the single burner consuming 10 and the double burners 20 feet of gas per hour. The catalogue shows the American Junior, New Enterprise and Columbia hot plates or table stoves, the American china kiln and a variety of styles of gas heaters.

GAS STOVES, both for heating and for cooking, appear to be becoming more and more popular, says a London paper. According to the experience of the Gas Light & Coke Company the demand for them is increasing by leaps and bounds. In 1889 the rentals yielded a revenue of £5860; last year the income from this source had risen to no less than £18,872. Nor is this London's testimony only. From Norwich and Ipswich come reports that the adoption of these modern substitutes for kitcheners and grates has already materially affected the carriage of coal in that part of the country.

THE MARION STOVE COMPANY, Marion, Ohio, have brought out a new heater for 1895 named the Retort Oak. It is built upon the same principle as the company's well-known Retort stove, which has proved by years of success that it is possible to burn soft coal and at the same time secure a steady fire, freedom from smoke or soot and safety from gas. This is done by fitting the stove with a magazine of peculiar construction so that the fire is properly fed. The Retort Oak is of handsome appearance, having an ornamental nickel foot rall completely encircling the stove, an ornamental base, full mica illumination around the fire chamber, an artistic name plate over the central door and a well finished swing top with a graceful urn. This stove is made in two sizes, 16 and 18 inch.

AN ACTION to foreclose the trust deed on the Superior Stove Company's property, at Superior, Wis, has been filed by the Keystone National Bank, trustee. This is expected to lead to a speedy reorganization, after which the plant may be started again.

WE ARE INDEBTED to the Eclipse Stove Company, formerly the Van Wie Gas Stove Company of Rockford, Ill., for a copy of a 40-page catalogue of gas stoves which they manufacture. In the announcement to the trade attention is called to the fact that the new concern own and control all rights, titles, patterns, patents, &c., of the Van Wie Gas Stove Company, and that the manufacture of all old style stoves will be discontinued. Nothing but the latest improved goods will be turned out, special attention being given to increasing the capacity of the stove and making it possible to change a three to a four and a four to a five burner; adding a water heater, high broiler, warming oven, &c., and replacing old linings without dismounting the stove. The Eclipse Gas Stove Co. state that they will also manufacture a line of cheap one, two and three burner boiling stoves and a hotel and restaurant cake baker. The goods illustrated are for the most part cabinet ranges, the engravings being accompanied by brief descriptive par-.

ticulars, dimensions of the various parts, &c. In connection with the description of their water heater a sectional view is given showing the internal construction. A list of repair parts, reference to the Eclipse ventilated oven, sad iron heaters, soldering furnaces, &c., constitute other features of interest.

THE ANNUAL STATEMENT of the Michigan Stove Company's Employees' Mutual Benefit Association, covering the period from February 20, 1894, to February 19, 1895, shows receipts of $3693.49, and disbursements of $1529.16, leaving a cash balance of $2164.33. The total benefits disbursed during the period named amounted to $1424.16, and the total amount paid in benefits since the organization of the association, May 12, 1882, aggregates $18,336.01. From this it will be seen that the association is more than self-sustaining, and the benefits paid have in many cases helped to tide over what would otherwise have proven very serious situations.

THE WORKERS IN STOVE LINES in Albany, N. Y., are rejoicing in the prospect of a more prosperous season than the city has seen for several years. During the recent depression in the iron market local manufacturers purchased a great deal of material at reduced rates, so that they are admirably situated at this time to take advantage of the constantly improving pulse of the stove trade in general. As far as Albany is concerned, the demand for heating goods has seldom been greater at this time of the year, especially in contrast with the sales of the past several years. In consequence of a hopeful view of affairs caused by the improvement of the local and general market, Rathbone, Sard & Co. have satisfactorily settled all minor differences with their employees and will set their big stove foundry in operation again on Monday next, March 25. They will at the start employ 150 men and increase that number as business warrants. A large number of Albany iron workers have been out of employment for many months, but the men are congratulating themselves that from present indications there will be work for all before the season is very far advanced.

THE FOUNDRY of the Bussey & McLeod Stove Company, Troy, N. Y., started up again Thursday, March 14, the shut down having been of several weeks' duration. A limited number of men is employed at present, but it will probably soon be increased. The foundry was all ready to resume operations on the Tuesday morning previous, but a cylinder broke on the engine and repairs necessitated a delay until Thursday, when they were completed.

AN ENGLISH WOMAN, writing from Singapore, says: "All the cooking is done in a kitchen at the back of the house. Our cook uses coke as fuel; but wood or charcoal is the general fuel in Singapore. The appliances are very simple, but the Chinese cook can serve up a dinner equal to any to be found in the best houses in England. Cooking by gas, excepting at one of the hotels, is quite unknown in Singapore, as the Chinaman is very conservative, and will only work in the way he has been accustomed to. I have my own pet gas stove, so as to occasionally amuse myself by preparing a special dish or two; but the Chinese cook is very jealous of my work, and is always rather sulky when he sees 'Mem' cooking anything. When I say that there is not a chimney on a dwelling house in Singapore, and not a fire place in any of the rooms, it will give people at home a little idea of the unhomelike look of the town."

THE TROY OIL STOVE COMPANY, Troy, N. Y., manufactures of the Beauty oil stoves, have appointed Reeves & Smiley, Philadelphia. Pa., and C. T. Corly, Brooklyn, N. Y., agents for the sale of their goods.

THE COLLINS & BURGIE COMPANY have removed their shipping department from Chicago to Marengo, Ill. Manager Albert Moffat has transferred his headquarters to the works at Marengo, but a salesroom and sample room will still be maintained at 225 West Twelfth street, Chicago, under charge of James A. Lounsbury, secretary of the company. All shipments of either large or small lots will hereafter be made from Marengo.

THE DETROIT STOVE WORKS of Detroit, Mich., favor us with a copy of their 1895 catalogue, which they have recently issued, illustrating and describing the Detroit Jewel gas stoves. The publication is attractively printed in a blue black ink and bound in paper covers, with embossed side title in old gold and deep blue. The Detroit Jewel ranges are of rich ornamentation, substantial construction and embody the latest features of convenience and utility. They are offered in various sizes, and in connection with each illustration are given prices, code words and weights. The body of the Detroit Jewel range is of cold rolled steel, lined throughout with asbestos. The top plate is extra large and the grates are of proper hight for good combustion and made to allow for expansion when heated, so they will not crack. The oven doors are balanced, the spring being covered and so arranged that when the door drops the latter is flush with the oven bottom. The face of the door is smooth steel, forming a strong and convenient shelf when opened. Some of the opening pages are devoted to Detroit Jewel burners, while others are devoted to illustrations of Detroit Jewel hot plates.

A Problem in Hydrostatics.

At a recent meeting of the Engineers' Club of Philadelphia, C. H. Ott described an ingenious solution of a problem in hydrostatics which had come under his notice at the town of Anniston, Ala., in 1882. Works there established for the purpose of water supply and fire protection for the industrial establishments consisted of a well 10 feet in diameter, driven to a water bearing stratum 80 feet below the surface of the ground, and containing a double acting single cylinder pump located about 15 feet above the bottom of the well and worked from the pump house above.

As the water required at the time these works were established was not very heavy, the supply from the well in six hours of pumping was sufficient for 12 hours of service, and the engine and pump had sufficient capacity to empty the well within 8 or 10 feet of the bottom in about 12 hours of continuous working. When it became necessary to repair or examine the pump cylinder the water was lowered by pumpage to the greatest possible extent, and then, by means of a steam jet, the well was kept drained

As the town grew, the supply from the well became inadequate, and a new well was started about 40 feet east of the pumping well. A shaft 6 x 12 feet was driven to a depth of 120 feet, where a flow of water was had. In order to provide storage for water, and to connect the new shaft with the pumping well, a timbered drift, 4 x 6 feet, was run to directly beneath and about 40 feet below the bottom of the pumping well. The water supply not yet being deemed sufficient, an 8-inch well, cased with pipe, was bored in the new shaft to a depth of 230 feet below the pump house floor, and a great flow of water was struck. The drill in passing through the disintegrated limestone bored a much larger hole than 8 inches in diameter, so that large quantities of water passed up outside of the casing. When the depth of 230 feet was reached the latter quantity was so great that the water level in the new shaft could not be lowered and maintained with the apparatus at hand to more than about 20 feet below the pump house floor. An 8 inch hole was then drilled from the bottom of the pumping well to the drift below. It was still found impossible with all of the pumps and jet apparatus available to lower the water level in the pumping well to more than about 25 feet below the pump house floor, thus furnishing an ample water supply.

Some months after these arrangements had been finished a failure occurred in the pump cylinder under 50 feet of water, and with no apparatus available to lower the water in the well sufficiently to make the necessary repairs. After several expedients had been tried the following contrivance was devised:

A balloon shaped bag, in dimensions about 3 feet in diameter and 6 feet long, was made of six plys of bed ticking, roughly quilted into squares. The bag was soaked in linseed oil, and a quantity of rye flour inserted and well shaken around. A 1-inch pipe terminating in a sleeve was inserted in the mouth of the bag, which was then securely wired around the pipe. Sewn to the bottom of the bag was a stout ring and to this was wired a half pig of iron by a ring bolt inserted into its end. The bag was then wrapped tightly with twine into a cylindrical shape and was lowered into the drill hole in the pumping well by means of sections of pipe until the weight struck bottom; by estimation one-half of the bag entering the drift below, the remainder being in the drill hole. The 1-inch pipe was then attached to the service main through a stop cock and a pressure gauge attached thereto, and the bag was slowly distended until a pressure of 50 pounds per square inch was reached and maintained. The upper part of the bag swelled out and accommodated itself to the irregularities of the drill hole, the lower part of the bag swelled out into a bulb shape, the whole resembling an inverted champagne bottle cork. The drainage pump and steam jet were then set to work and speedily emptied the pumping well, the bag being held in shape during the lowering of the water by an interior water pressure of about 10 pounds per square inch in excess of the exterior water pressure. The repairs to the pump having been readily made the water was exhausted from the bag and the apparatus withdrawn.

As the materials not already on hand could only have been obtained by express in about 48 hours, and as the contrivance described was easily made and did the work so quickly that the pumping engine was stopped only about ten hours, Mr. Ott considered that the treatment of this problem was a most ingenious and clever solution of what threatened to be a most serious condition of affairs for that neighborhood.

TRADE REPORT.

The Iron Market.

The advance in wages voluntarily granted to the men in the Connellsville Coke region has been a startling surprise, and has appeared to many a revelation concerning the movements of a leading Pittsburgh interest. The other operators have fallen into line promptly. A good deal of guessing is being done as to the position in which some of the Coke operators, furnace companies and Steel producers find themselves. Have Coke producers sold largely at 90¢ up to July? Have furnace interests contracted to sell Bessemer Pig for the second quarter at the low prices recently ruling without covering their Coke requirements? These are the questions which are being eagerly asked.

It is pretty well known that nearly everybody has stocked up with Coke lately as fast as possible. It is a matter of fact that stocks of Pig Iron have increased during the past few months. These points are in favor of the surprised buyer.

The one argument on the other side is that prospective cost has gone up. In other words, more money must be asked for crude and finished products as soon as the supplies of cheap Coke are exhausted. Whether the advance will be 25¢ or 35¢ ℔ ton is still a question.

It may as well be acknowledged that many in the trade regard the movement with suspicion. They urge that the market is being taken hold of by the wrong end, and that only an increased demand and not a forced rise in the cost can bring about a lasting improvement.

Against that it may be urged that after all it is largely a matter of sentiment; that the industry must be jerked out of the old rut; that if that is once done, no matter how, the right start has been made, to which many will give their powerful aid.

Pig Iron.—The New York market is quiet and displays a weakening tendency so far as prices are concerned. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

In the Philadelphia market sellers are talking a little more money; some who sold at $11 for No. 2 Foundry X claim to be holding firm for $11.25, and those who sold at $11.25 similarly ask $11.50. No objection will be made to these prices, providing that the movement is uniform all along the line. Consumers would be glad to see an advance, the great point being not to pay more than others are paying. It is thought not unlikely that prices will stiffen up, and it is doubtful if the inside figures of last week would be accepted as readily as they were at that time. Producers feel more encouraged than they have done for some time past. Quotations are usually given about as follows, but it is not improbable that the inside figures will be more of an exception than they have been heretofore:

Standard No. 1 Foundry X	$12.00 to $12.50
Standard No. 2 Foundry X	11.25 to 11.50
No. 2 Plain	10.75 to 11.00
No. 1 Soft	11.50 to 11.75
No. 2 Soft	10.75 to 11.00

Another week of increasing business in local Coke Iron marks the advance toward better times in the Chicago market. A decided improvement in inquiry has taken place, and consumers are buying small lots very freely, with some disposition to increase their shipments. Some expectation exists of an advance in local Iron in consequence of higher prices on Connellsville Coke, although it remains to be seen whether West Virginia Coke will also be advanced. Unless this is done it is likely that the proportion of West Virginia Coke used here will grow considerably. Southern Iron was comparatively quiet during the week. The outlook for next week's business is much better, as quite a number of good inquiries have recently developed. An item of interest to foundrymen in adjacent towns is the notice which has been given of an advance on freights to those points of 20¢ ℔ ton from Southern localities. Prices have recently relaxed to some extent, and our quotations are revised accordingly. Quotations are as follows for cash:

Lake Superior Charcoal	$12.75 to $13.00
Local Coke Foundry, No. 1	10.25 to 10.50
Local Coke Foundry, No. 2	9.75 to 10.00
Local Coke Foundry, No. 3	9.50 to 9.75
Local Scotch No. 1	10.25 to 10.50
Ohio Strong Softeners, No. 1	12.50 to 13.00
Southern Silvery, No. 1	11.50 to 11.75
Southern Silvery, No. 2	11.25 to 11.50
Southern Coke, No. 2	10.00 to 10.25
Southern Coke, No. 3	9.50 to 9.75
Southern, No. 1, Soft	10.00 to 10.25
Southern, No. 2, Soft	9.75 to 10.00

Careful inquiry shows that most furnaces in the Pittsburgh district whose Coke contracts expire on March 31 have very little Iron sold ahead at low prices. Those who sold ahead based on 90-cent Coke will probably prefer to close down in preference to paying higher prices for Coke and making the Iron at a loss. As to Pittsburgh prices, little can be said. Furnaces whose Coke contracts expire with this month are refusing to quote. Those who have cheap Coke up to July 1, are holding off to see whether higher prices will not come. In the absence of any recent sales we quote nominally as follows:

No. 1 Foundry	$10.50 to $10.65, cash
No. 2 Foundry	9.65 to 9.70 "

The buying movement in the Pig Iron market at Cincinnati continues quite active, but while there is an evident disposition among consumers to provide for their wants, in part at least, for the next four or five months, they are unwilling to meet any demand for higher prices and thus far the increased volume of business has not resulted in any appreciation of values. The largest buying during the past few days has been by rolling mills in the northern part of the State. There have also been several contracts of moment placed by local foundries. The sales to foundries were mainly of No. 2 Foundry. One encouraging feature is the number of small sales making from single cars up to 500 ton lots and the diversity of interests covered by the buying movement. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.00 to 9.25
Southern Coke, No. 3	8.50 to 8.75
Ohio Soft Stone Coal, No. 1	14.50 to 15.00
Ohio Soft Stone Coal, No. 2	14.00 to 14.50
Lake Superior Coke No 1	11.75 to 12.25
Lake Superior Coke, No. 2	10.75 to 11.50
Hanging Rock Charcoal, No. 1	16.00 to 16.50
Hanging Rock Charcoal No. 2	15.50 to 16.00
Tennessee Charcoal, No. 1	13.00 to 13.50
Tennessee Charcoal, No. 2	12.00 to 12.50
Bessemer	11.65 to 12.00

Metal Market.

Pig Tin.—There has been a sharp rise in prices on both prompt and future deliveries and more or less excitement in the wholesale market at times, yet a smaller volume of business than might have been expected under the circumstances. On prompt and current month delivery the advance was about 0.70¢. May delivery moved up 0.60¢ and later futures 0.40¢ @ 0.50¢. Speculative dealings, however, did not involve much, if anything, over 500 tons, despite this movement in values and remarkably heavy trading in London. Out of town jobbing purchases were merely routine in character and nothing more than the average business was done with consumers. Not a few of the latter have a good stock from deliveries made on prior purchases and requirements generally seem to have been so well covered that the speculative flurry stimulated purchases in a very moderate degree only. The rise in prices was due chiefly to comparatively light shipments from the Straits and the advance in silver. The shipments during the first half of March were 1460 tons, of which 230 tons to the United States, 900 tons to London and 230 tons to the Continent, against 1775 tons in the corresponding period last year. Quotations on small lots of Straits from store are virtually unchanged at 14½¢ @ 15¢ ℔ lb.

Copper.—Continued pressure to sell has caused a further decline in prices and the market remains unsettled and depressed. Home consumers have taken a very fair amount of Copper through closing contracts previously pending and new purchases at the lower range of prices. Electrolytic sorts fared relatively the best. Some export purchases have been made and more or less stock has gone abroad on consignment. The entire movement, however, has little effect against the depressing influence of large supplies at the mines and continued heavy production. Exports from this port the past week include 253 tons Plates, 60 tons Ingots, 130 tons Pigs, 40 tons Bars and 290 tons Matte. In small retail business inquiry has been only moderate and prices unchanged on a basis of 10½¢ for Lake Ingot in small parcels.

Sheet Copper.—While the demand for cornice Copper is fully equal to if it does not exceed that of last year at the same time, it still lags behind the average of a good season. Inquiry is, however, rather more active and the

large amount of building in prospect in this section gives promise of much better trade later in the year. Small lots of sheet Copper from store are quoted at the net list price of 14¢ ℔ lb.

Pig Lead.—A decided change has taken place in the market and there are indications that the long drawn out contest between prominent consumers and producers has ended, temporarily at least. In any event it is the fact that fully 2500 tons have been taken by home consumers and that nearly or quite 1500 tons were purchased for export. Export purchases were stimulated by a rise in London prices, due to comparatively light stocks of Spanish and English Lead there, and home trade buying was helped along by that circumstance and knowledge as to the favorable statistical position on this side of the Atlantic consequent upon restricted production here during the winter months. Jobbers report a rather light demand for both Pig and manufactured Lead, with no changes in the prices for small parcels quoted last week—namely, 3¼¢ for American Pig, 5¼¢ for Pipe, and 6¼¢ for Sheet; the two last quoted being subject to a discount of 20 %.

Spelter.—Nothing more than routine business has been effected in this market, and there is little if any change as regards demand. In short, the market here is still a very narrow one in all particulars. Enough orders go out from other quarters to keep the primary market in very fair shape, however. Prices for small lots of good Western brands from store are quoted at 3¾¢ @ 4¢ ℔ lb.

Antimony.—Jobbing business is fair, but otherwise there is little doing. Prices for small parcels are quoted at 9¼¢ @ 9½¢ for Cookson's and 8¢ for Hallett's.

Nickel.—Seller's quotations remain at 35¢ @ 40¢, as to size of lot.

Tin Plate.—Having passed the proverbially fatal "ides of March," the long and continuous period of dullness in the Tin Plate trade seems to have been broken. A better tone has developed in the market, and some quite liberal purchases have been made of ordinary Coke Plates for delivery during the spring months. There has also been more general buying of spot stock, low prices having at length served to stimulate purchases. Assistance to sellers has come also from the curtailment of production abroad, and the consequent depletion of stocks, leading to a general hardening of prices to a greater or lesser extent all along the line—that is to say, concessions on quoted rates are less readily given. No quotable change in prices has taken place, however. The weather has been against building operations, and the call for Roofing Plates has been very moderate accordingly. Small business is still behind the average, and the size of individual orders does not yet increase much beyond the limit of present requirements.

A special London cable dispatch of March 20 to *The Iron Age* reports as follows in regard to the British Tin Plate market: In the Tin Plate market there has been a change for the better. Inquiries have improved decidedly and buyers are offering 3 half-pence over last week's bids. Sellers' figures are up 3 pence from the lowest point touched. Large lines for Russia have been placed and there is improved demand from the Continent. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20	9/1½	@ 9/3
Siemens Cokes, IC 14 x 20	9/4½	@ 9/6
Ternes, 20 x 28	17/6	@ 22 6
Charcoals, IC 14 x 20	10/	@ 13/

Sheet Iron.—Both Black and Galvanized Sheets are in exceedingly good demand. Mills are well supplied with orders, and manufacturers are showing some disinclination to contract for future deliveries, particularly in view of the possibility of an advance in Billets. Values are, however, as low as ever, notwithstanding that the leading mills are refusing to book at the lowest prices prevailing. Small lots of No. 27 Common Iron are quoted at 2.60¢ @ 2 65¢ from stock and of Galvanized at 75 and 10 % off.

Chicago Report.

Scrap.—Business continues fair, with a marked scarcity in Cast Scrap. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per ℔
No. 1 Wrought Scrap	$6.50	....
Machinery Cast	5.50	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....

Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	6 ¢
Light Brass	....	3 ¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2¼¢
Rubber	....	4 ¢

Anthracite.—Trade is quiet. Winter is about over, and little will now be done for several months. Dealers here have large stocks with which to enter upon another season. Carload lots of 12 net tons or over are quoted as follows, although some concessions are now being made:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$4.75	$5 00
Milwaukee, Wis	4.75	5.00
Kansas City, Mo	7.95	8.20
Council Bluffs, Iowa	7.95	8.20
Lincoln, Neb	8.10	8.35
Sioux City, Iowa	7.95	8.20
Aberdeen, S. Dak	8.00	8.25
Dubuque, Iowa	6.05	6.30
Madison, Wis	6.25	6.50
St. Paul, Minn	7.25	7.50
Burlington, Iowa	6.25	6.50

Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

A MEETING of the Canadian tinware manufacturers was held last week in Montreal, and was attended by representatives of all the leading firms. Some changes were made in the list prices of goods and a number of important lines of goods were withdrawn from the association's list and will henceforth be sold at open prices.

CONDITION OF THE

Hardware Trade.

TRADE runs along without any important modification in volume, the demand being somewhat uneven, and, to a certain extent, spasmodic. Seasonable goods are moving with a fair degree of freedom and constitute a considerable portion of the current business. It is evident that trade in general is, on the whole, better in the West than in the East, and the reports which come from many Western points are gratifying. It is the view of many well-informed persons that as soon as moderate weather prevails in the East there will be a marked quickening in the demand, and that business will assume something like its normal volume. Advices from architects and others in close touch with builders indicate that there will be an increased amount of building this year, and some are taking sanguine views of the prospect. The outlook for the market in general would be much more satisfactory if there were evidences of a decided improvement in its tone so far as prices are concerned, but these unfortunately continue without showing many signs of firmness. Some of the staples are not apparently quite as strong as a short time ago, and on many classes of Shelf Hardware and miscellaneous goods prices are somewhat ragged, furnishing sufficient reason for the manufacturers' complaint of their unprofitableness. Manufacturers are, however, learning to be more conservative than formerly, and some of them are holding aloof from the market for a while rather than force the sale of their goods by further concessions. Stocks certainly are low both in the hands of producers and the trade, and a sudden demand would in many lines cause something of a scarcity.

Advices from Chicago.—The past week showed a rapid growth in the volume of business. A leading house here is reported to have received on Monday the largest mail in any one day for three years. Orders are not only more numerous, but they are steadily growing larger. One of the strongest features of the trade to which allusion has previously been made is the continuous demand for new stocks of goods. Scarcely a day passes that a new stock is not purchased in this jobbing center. Orders of this character swell the volume of business very decidedly. The general demand for goods is still of a hand to-mouth character, orders being sent in only when the goods are needed. This is shown by the urgent demand for prompt shipment. Tinware has been moving much more freely. The only material change in prices recently made is an advance of 5 per cent. on the new list of Carriage and Machine Bolts. Excepting the cut in Wire Nails, nothing has happened so far this year to seriously disturb the even course of the jobbing trade in this locality. No serious cut has been made in any other class of goods by jobbers in order to induce trade, as has been the case in previous seasons. The Nail situation now promises to adjust itself, and in a short time this irregularity will probably be eliminated. Heavy Hardware is picking up, particularly with agricultural implement makers.

Notes on Prices.

Wire Nails.—The Wire Nail market is characterized by a good degree of activity and many inquiries are being received by the manufacturers. It is evident that there has been quite a free movement of Nails from jobbers to retailers, making it necessary for the former to replenish their stocks. There is no doubt that the fact that the jobbers, especially some of the Chicago houses, have been underselling the manufacturers has had an injurious effect on the market as a whole. The situation is, however, referred to by the manufacturers as very satisfactory, and the expectation is expressed that prices will be well maintained and the volume of business large.

Advices from Chicago.—Manufacturers report a very strong movement in carload lots, with further indications of a much larger trade with the fine spring weather now extending over the Northwest. All buyers are pressing for immediate shipment. Factory prices are quoted on the basis of $1, Chicago, for carload lots, and $1.05 for small lots. A few jobbers continue to name 95 cents for carload lots, but this price is not so freely given as was the case earlier in the season, and it is now regarded as likely to be withdrawn at any day. Jobbers' quotations usually are $1.05 for shipments from stock.

Cut Nails.—During the past week there has been a good business in Cut Nails. Inquiries have been many and orders satisfactory considering the season and the general condition of trade. Small lots from store, New York, at 85 to 90 cents.

Advices from Chicago.—The trade in Steel Cut Nails pursues the even tenor of its way. Orders are fair and business is steady. Small lots from stock are selling at $1.

Barb Wire.—The Barb Wire marke is fairly active and little complaint is made in regard to the volume of business. The outlook also for the season continues good. A slight weakness has, however, been developed in prices and the market is represented by the quotation of $1.85 to $1.90 for carload lots of Four-Point Galvanized at mill. Some of the jobbing houses are offering Wire at the above figures and in some instances slightly shading them.

Advices from Chicago.—The demand is increasing in parallel lines with that for Wire Nails. Shipments from factories are very heavy and the time seems to be close at hand when it will be impossible to make prompt delivery on orders received. Small lots from stock are selling at $1.65 for Painted and $2 for Galvanized.

Shot.—Announcement is made that on and after March 18, 1895, the 2½ per cent. discount heretofore allowed to ton lot buyers of Shot is withdrawn. The following are the present terms and prices, terms net 30 days, or 2 per cent. discount for cash in ten days from date of bill, a discount of 5 cents per bag (25 pounds) being allowed on lots of 2000 pounds and upward taken at one time:

Drop Shot up to B, 25-pound bag	$1.15
" " 5 " "	.30
Buck Shot (including Bs, Ts & F.), 25-pound bag	1.40
Buck Shot (including Bs, Ts & F.), 5-pound bag	.35
Chilled Shot, 25 pound bag	1 40
" 5 "	.35
Dust Shot, 25-pound bag	1.75
" 5 "	.40

Water Filters.—A description of the Cataract and Ideal Water Filters of the Germ Proof Filter Company, 16 Cedar street, New York, was given in last week's issue. These Filters are sold to the trade from the following list, which is subject to a discount of 33⅓ per cent.:

	Per dozen.
Cataract Water Filter	$18
Ideal Water Filter	30

Glass.—There is no reduction in the number of window Glass factories in operation, owing to the limited demand and the low prices which have been ruling for some time. It is reported that at the meeting of Window Glass manufacturers held at Pittsburgh, Pa., March 19, an association was formed to be known as the National Association of Window Glass Manufacturers. The next meeting of the manufacturers will be held in Pittsburgh some time in April, which is expected to develop the result of the various conferences and meetings. The fact that the Glass manufacturers were considering a plan to put the manufacture of Glass on a more profitable basis, taken in connection with the near approach of spring trade, may have influenced the makers to some extent. Plans are being matured for bringing all the plate Glass factories under one management, and it is reported that orders for plate Glass are being placed more freely.

Old Metals.—Rather more business has been done, but stocks are amply sufficient to meet all requirements. Consequently dealers have not advanced their purchasing prices to any quotable extent. The following represent about the rates now ruling for New York deliveries:

Heavy Copper	℔ 7 ¢
Light and Tinned Copper	℔ 6¼¢
Heavy Brass	℔ 4¾¢
Light Brass	℔ 3¾¢
Lead	℔ 2¾¢
Tea Lead	℔ 2½¢
Zinc	℔ 2⅜¢
No. 1 Pewter	℔ 10 ¢
No. 2 Pewter	℔ 5½¢
Wrought Scrap Iron, ℔ gross ton	$7.50 @ $8.00
Heavy Cast Scrap....℔ gross ton	7.50 @ 8.50
Stove Plate Scrap....℔ gross ton	5.00
Burnt Iron....℔ gross ton	3.00

Old Rags, Paper, &c.—The demand for Paper Stock is fair but somewhat irregular. Dealers' purchasing prices have not advanced any, quotations being as follows for this city:

No. 1 White Rags	℔ 3 @ 3¼¢
No. 2 White Rags	℔ 2¼ @ 2½¢
Mixed Rags	℔ ¾ @ 1 ¢
Blues and 3ds	℔ 1⅛ @ 1⅜¢
Hard Sized White Shavings	℔ 2⅛ @ 2¼¢
No. 1 White Book Shavings	℔ 1¾ @ 2⅛¢
No. 2 White Book Shavings	℔ 1 @ 1⅛¢
Light Book Shavings	℔ ⅝¢
No. 1 Mixed Shavings	℔ ⅞ @ 1 ¢
No. 2 Mixed Shavings	℔ ⅝ @ ¾¢
No. 1 Printed Books	℔ 1 @ 1¼¢
Ordinary Mixed Books	℔ ½ @ ¾¢
Newspapers	℔ ½ @ 3-5¢
No. 1 Manila Paper	℔ ¾ @ 1 ¢
No 2 Manila Paper	℔ ⅝ @ ¾¢
Bogus Paper	℔ ½¢
Common Paper	℔ ¼ @ ⅜¢
Straw Chips	℔ ⅜¢
Binders' Clippings	℔ ⅝¢
Jute Butts	℔ 1½ @ 1¾¢
No. 1 Jute Bagging	℔ 1 @ 1¼¢
Mixed Bagging	℔ ¾ @ 1 ¢
No. 2 Bagging	℔ ½ @ ¾¢
Hemp Twine	℔ 2 @ 2¼¢
Manila Rope	℔ 2 @ 2¼¢
Jute Rope	℔ 1½ @ 1¾¢
Mixed Rope	℔ ¾ @ ⅞¢

Old Rubber.—The following quotations represent about the prices paid by dealers, New York delivery:

Car Springs, ton lots, ℔	$0.03¾ @ .04
Rubber Shoes, carloads, delivered at factory, ℔	@ .05¼
Rubber Shoes, less than carleads, ℔	@ .04¾
White Wringer Rolls, ℔	@ .03⅞
White Syringes, ℔	@ .03⅞

It Is Reported—

Colorado.

That A. G. Sherwin has disposed of his Hardware store, at LOGAN, to Frank Phillips. Mr. Sherwin will, however, continue in the coal and lumber business.

Illinois.

That the partnership between C. R. Rogers and J. H. Vawter, under the firm style of Rogers & Vawter, SALEM, has been mutually dissolved. Mr. Vawter will continue the Hardware business and Mr. Rogers the produce business.

That Keator & Thompson are a new Hardware firm at PAXTON.

That James Glanville has bought out Frank P. Voght in the Hardware business at STOCKTON.

That J. W. Shuck has disposed of his Hardware business at URBANA to W. I. Saffell.

That E. S. Hubbell, in the Hardware business at THAMESVILLE, has been succeeded by Hambly & Hodgson.

That J. L. Drainie, Hardware, FERGUS, has sold out to Nichols & Co.

That George A. Trotter, Hardware merchant of COAL CITY, has purchased the Hardware store of Thomas Jack at SPRING VALLEY. Ford Cumming, who has been in Mr. Trotter's employ at COAL CITY, has been placed in charge of the SPRING VALLEY store.

That J. M. Hart's Hardware store at MINIER was burglarized on the 28th ult. About $200 worth of goods were taken away.

That L. Beringer, Hardware dealer, 1611 Wabash avenue, CHICAGO, has been robbed so frequently of late that he is thinking about going out of business before the thieves carry away all his goods. He estimates his losses at $1500.

Indiana.

That William P. Ritterskamp & Co., VINCENNES, have sold their Hardware store to E. A. Ritterskamp of BICKNELL and August Meise of VINCENNES. The new firm will be known under the style of E. A. Ritterskamp & Co.

That Clingenpeel & Krauss' Hardware store, at FLORA, was consumed by fire on the 6th inst.

That William Cover has purchased the interest of his partner, Lee Fishbaugh, in the Hardware business, at MARKLE, and will continue the store under his own name.

That Monroe & Holloway's Hardware store at NEW CASTLE was burglarized on the 7th inst.

Iowa.

That Louie Peterson, a farmer of PARKER, has traded his farm and live stock for a Hardware store at GILMORE.

That the Lone Tree Hardware Company, LONE TREE, have sold their store to Geo. Silverly.

That White & Van Patten are building an addition to their Hardware store at HUBBARD.

That Herman DeKraay of the firm of DeKraay & Rozeboom, Hardware merchants, ORANGE CITY, has sold his interest in the store to John H. D. Hartog.

That the Hardware firm of Rohenkohl & Duke, WATERLOO, have dissolved partnership. C. M. Newton has purchased Mr. Duke's interest.

That J. Wise's Hardware store, at DOW CITY, was destroyed by fire on the 26th ult.

That James Sciscoe and D. N. Wilson have opened a new Hardware store at MEDIAPOLIS.

That J. W. Thompson, BRITT, has nearly completed his new Hardware store.

That EAGLE POINT has a new Hardware store, conducted under the style of Scholz & Wimmer.

That S. B. Lattner has sold his Hardware store, at WORTHINGTON, to M. Kremer and H. Fiedler.

Kansas.

That the store of the Axtell Hardware Company, AXTELL, was consumed in a large fire at that place on the 12th inst.

Massachusetts.

That Henric C. Fay is successor to L. C. Parmenter & Co. in the Hardware business at ATHOL.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

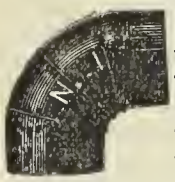
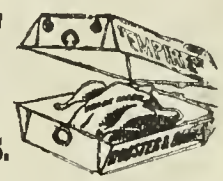
WASH BOILER HANDLE



PATENTED.

We call the trade's special attention to the Royal Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.



The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

SECOND EDITION.

PRACTICAL HINTS
—ON—
JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

WITH THIRTY-FIVE ILLUSTRATIONS.

48 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

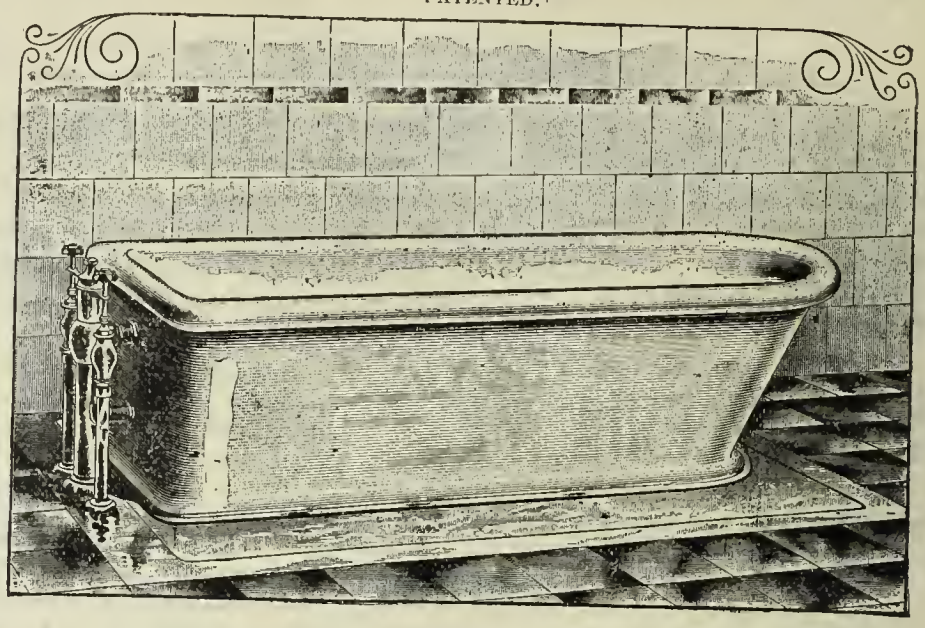
Thomas Kelly & Bro.,

124 Franklin St., Chicago,



Manufacturers of Permanent Plumbing Goods.

DO YOU WANT A PERFECT BATH TUB?

THEN USE

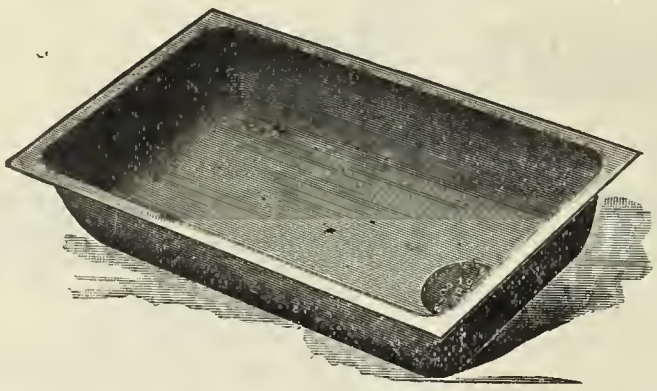
"THE PURITAN ROLLED RIM."

PATENTED.

Since the introduction of Iron Bath Tubs there have been objections made to their height, they being very inconvenient to get in or out of; also, difficult to clean beneath them. We have overcome both these objections in the "Puritan" Bath.

In the first place, while retaining the full size inside, it is 8½ inches less in height from the floor to the top of the rim, thus making it very much easier of access.

In the second place, by using the floor flange we dispense with the objectionable feet and floor space underneath, and also give the bath a better means of support than can be obtained by feet, and presenting as it does a plain, smooth surface both inside and out, it can easily be kept clean, and when in position it has a neater and more substantial appearance than a bath on feet.



THE BATH SETS INTO THE FLOOR ABOUT 2½ INCHES. We have these Baths fitted with a variety of Fixtures. Send for circulars.

— He Got There at Last.—The foxy boy applied for a job.

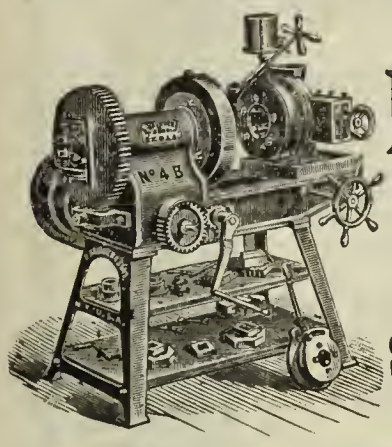
"Do you want a boy?" he asked of the magnate of the office, standing before him cap in hand.

"Nobody wants a boy," replied the magnate, eyeing him sharply.

"Do you need a boy?" asked the applicant, nowise abashed.

"Nobody needs a boy," came the discouraging reply.

The boy stuck his cap on the back of his head.



"Well, say, mister," he inquired, "do you have to have a boy?"

The magnate collapsed.

"I'm sorry to say we do," he said, "and I guess you're about what we want."

THE "WILKINS" IS KING

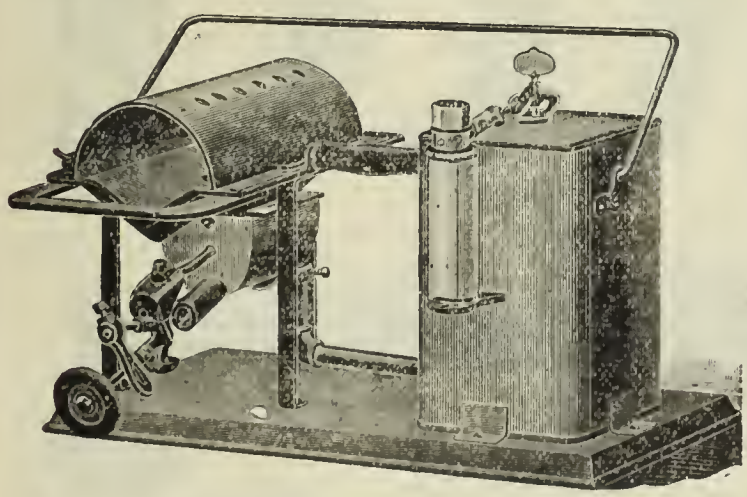
of Motor Pumps.

For filling tanks from cisterns, etc.

Superior to any other device for the purpose now on the market.

It is compact, simple, cheap and durable. Nothing to get out of order or leak. No drip pan is necessary to catch grease. Every pump guaranteed.

We manufacture a full line of High Grade Sanitary Specialties and invite correspondence.



THE

Columbus Brass Co.,

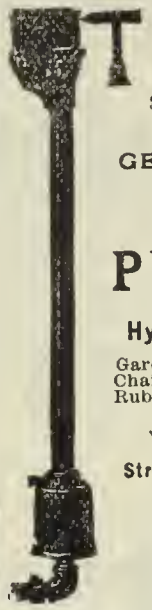
COLUMBUS, - - OHIO.

Hull's No. 3 Bonanza Furnace.

FOR TINNERS ONLY.

Price, Heavy Tin Tank, $6.00.
Price, Copper Tank, $7.00.
Price, Tin Tank and Bulb Pump, $5.50.

Very convenient for Bench use. Hinged arch top. Tin or copper tank. My new Bonanza double burner strikes the coppers on both sides. Hottest fire ever produced from gasoline. Will heat largest coppers fast enough to use. My Rubber Air Pump, Handle or Bulb Pump, as may be desired. The strongest wind can't blow it out. One dollar off cash with order. Write for circulars.



M L. HULL,
Cleveland, - Ohio.

When Painting Roofs,
When Painting Stacks or Boiler Fronts,

use Dixon's Silica-Graphite Paint and you will never regret it. Roofs well painted have not required repainting in 10 to 15 years. Graphite paint is equally useful for wood or metal. Send for circulars.

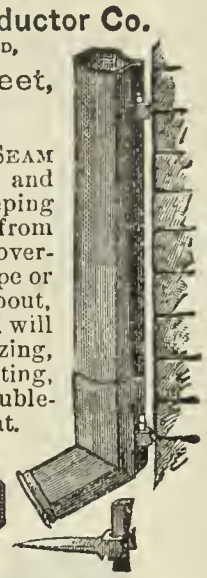
THE IRWIN & REBER

PATENT

EXPANDING WATER CONDUCTOR.



MANUFACTURED BY THE

S. S. S. Conductor Co.

LIMITED,

163 Lacock Street,

ALLEGHENY, PA.

THE STANDING SEAM allows of an easy and secure fastening, keeping the pipe far enough from the wall to make any overflow from the eave pipe or head, run down the spout, and not the wall; and will open, in case of freezing, so as to prevent bursting, and still remain double-locked and water-tight.

Made in 6-foot lengths of a single sheet of SOFT STEEL.

GALVANIZED, KALAMEINED or LEADED.

The Irwin & Reber Expanding Water Conductor Pipe has been extensively used through the United States and Canada for the past ten years and has proved itself to be the best in the market. Send for Price-List.

CLIMAX AUTOMATIC CELLAR DRAINER.

A Cheap, Reliable Remedy.

Never Failing.

It lifts water from Cellars, Wheel Pits, etc. and carries it into the street or sewer.

Requires no attention.

The Climax Gas Machine and Mixer stands at the head; makes brilliant, smokeless, steady and very cheap gas for stores, churches, etc.

CHAMPION of the WORLD.

(No reference to Mr. Corbett.)

In our "PENNSYL" OLD METHOD Terne Plate we have the Champion of all Champions *Roofing Plate*, a fact which is fully borne out by **Architects, Roofers and Builders.**

When we first introduced the "Pennsyl" it was with the intention that it should *always* be the Best and Leading Brand of Roofing Tin made, and it certainly is.

Just to think, every box contains *45 lbs.* of Pure coating. Other brands that are put in competition only have 30 to 36 lbs.

Every sheet guaranteed perfect in every way.

Every sheet stamped and squared.

We put it on the market in 1879 and we have been selling it continually since.

Agent: "That's all right. We never claim anything left over by a former tenant."

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

SIX SIZES OF NEW "STYLE C" INCLINABLE PRESSES, Heavy, Handsome, Durable and very Popular.

The Mere Money Getter.

There is not in the world a more ignoble character than the mere money getting American, insensible to every duty, regardless of every principle, bent only on amassing a fortune, and putting his fortune only to the basest uses—whether these uses be to speculate in stocks and wreck railroads himself, or to allow his son to lead a life of foolish and expensive idleness and gross debauchery, or to purchase some scoundrel of high social position, foreign or native, for his daughter. Such a man is only the more dangerous if he occasionally does some deed like founding a college or endowing a church, which makes these good people who are also foolish forget his real iniquity.

These men are equally careless of the workingmen, whom they oppress, and of the State, whose existence they imperil. There are not very many of them, but there is a very great number of men who approach more or less closely to the type, and just in so far as they do so approach, they are curses to the country. The man who is content to let politics go from bad to worse, jesting at the corruption of politicians, the man who is content to see the maladministration of justice without an immediate and resolute effort to reform it, is shirking his duty, and is preparing the way for infinite woe in the future.

Hard, brutal indifference to the right, and an equally brutal shortsightedness as to the inevitable results of corruption and injustice, are baleful beyond measure; and yet they are characteristic of a great many Americans who consider themselves perfectly respectable, and who are considered thriving, prosperous men by their easy going fellow citizens.—*Theodore Roosevelt in the Forum.*

— "Our engagement is quite a secret, you know."

"So everybody tells me."—*Pall Mall Budget.*

— Customer (timidly): "I—er—suppose you have some—er—suitable books for a man about to—er—be married?"

Head clerk (promptly): "Yes, sir; here, Skiggles, show this gentleman our line of largest sized pocketbooks."—*Buffalo Courier.*

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstration is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

PRICE, POST OR EXPRESS PAID, $5.

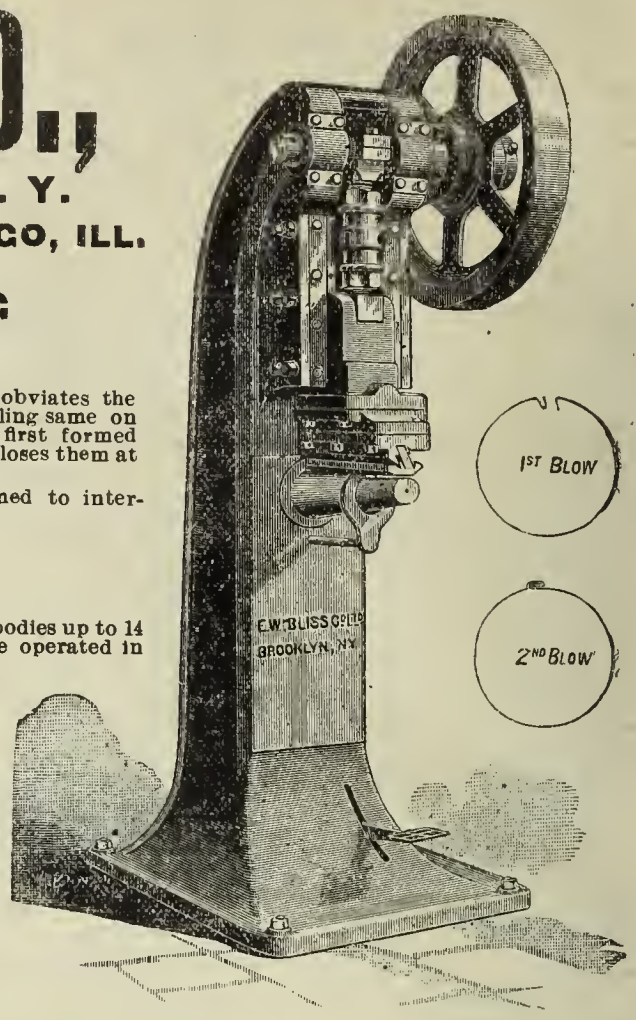
100-104 W. Washington Street, - CHICAGO, ILL.

DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



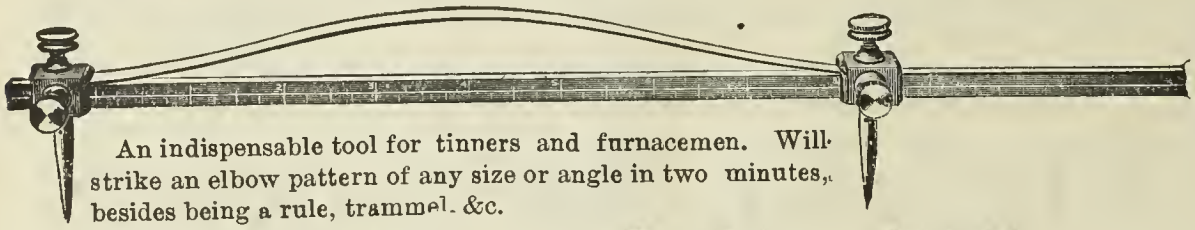
First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.



PRESSES, PUNCHES, SHEARS,

DROP HAMMERS,

DIES, SPECIAL MACHINERY &c.

THE STILES & PARKER PRESS CO.

An indispensable tool for tinners and furnacemen. Will strike an elbow pattern of any size or angle in two minutes, besides being a rule, trammel, &c.

"MAGIC" PATTERN RULE.

Price Reduced to $3.50 Net Cash.

Complete with Chart. Will pay for itself in a short time.

Send for Descriptive Circular.

LUFKIN RULE CO.

SAGINAW, MICH.

—ANOTHER MATTER.—Clara: "I hear your father has forbidden Mr. Higgins calling on you."

Cora: "No, you are mistaken."

"Did he not tell him last night never to darken his parlor again?"

"He did, but that referred to his turning down the lamp."—*Yonkers Statesman.*

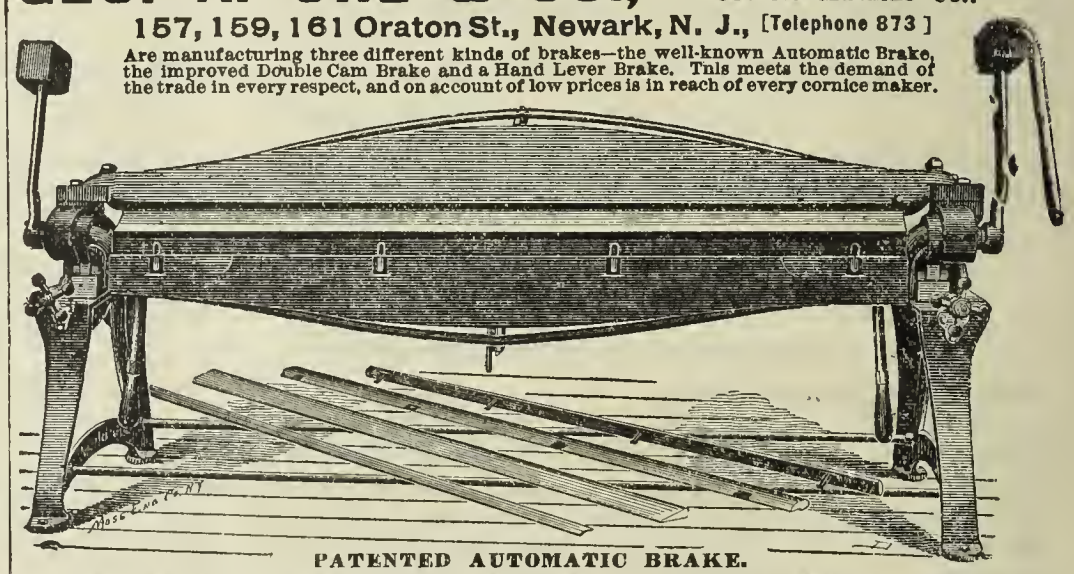
—CREDITOR (determinedly): "I shall call every week until you pay this account, sir"

Debtor (blandly): "Then, sir, there seems every probability of our acquaintance ripening into friendship."—*Pearson's Weekly.*

—TRUE FICTION. — "What are you writing, Hawley?"

"A story. I'm going in for fiction."

"Really! For a magazine?"



"No; for my tailor. He wants his money, and I'm telling him I'll send him a check next week."—*Harper's Bazar.*

GEO. A. OHL & CO.,

Successors to the Calvin Carr Cornice Machine Co..

157, 159, 161 Oraton St., Newark, N. J., [Telephone 873]

Are manufacturing three different kinds of brakes—the well-known Automatic Brake, the improved Double Cam Brake and a Hand Lever Brake. This meets the demand of the trade in every respect, and on account of low prices is in reach of every cornice maker.

PATENTED AUTOMATIC BRAKE.

We also manufacture Circular Machines, Squaring Shears, Slip Rolls, Drop Presses, Shears and Punches, Scroll Shears, Brace and Wire Benders, and all machinery used by sheet-metal workers. Special attention called to our improved Hammering Machines, patented December 27th, 1892 Send for our illustrated catalogue.

TRADE  MARK.

MANUFACTURERS OF

PATENT PLANISHED SHEET IRON,

PATENTED:

December 10th, 1878.	March 4th, 1884.	August 31st, 1886.
January 10th, 1882.	April 15th, 1884.	January 1st, 1889.
January 1st, 1884.	June 10th, 1884.	January 17th, 1893.
February 12th, 1884.	January 6th, 1885.	

Guaranteed fully equal, in all respects, to the IMPORTED RUSSIA IRON. **Also** WOOD'S SMOOTH FINISHED SHEET IRONS and SHEET STEEL of different qualities CLEANED AND FREE FROM DUST.

General Offices and Works, McKEESPORT, PA.

Branch Office, 111 Water St., Pittsburgh, Pa.

HAMILTON'S
BEST REDIPPED AMERICAN ROOFING TIN

is DIPPED AND REDIPPED by HAND, and is NOT coated by machines through ROLLS like some plates that are lauded so highly by the makers, and the coating on Hamilton's Best Redipped is as heavy on the TOP half of the sheet as it is on the BOTTOM half. You have scales, test it. We can furnish machine coated plates with 20 lbs. of coating to the box of I. C. 20 x 28 at $11.50 per box, fully equal to any of the so-called extra coated plates.

JOHN HAMILTON,
PITTSBURGH, PA.

McCLURE'S REDIPPED
ROOFING TIN.

AMERICAN MADE.

The finest and heaviest coated Roofing Tin made; guaranteed to contain **35 lbs. Coating** per 112 sheets.

A very important point in a Roofing Plate is to secure a uniform coating; **McClure's Redipped** is made by a process by which the coating is distributed **evenly over the sheet,** leaving no thick edges which are found on other "OLD STYLE" or "REDIPPED" plates, and which interfere to a great extent in working the sheets.

McClure's Redipped has been thoroughly tested and found to be of **superior quality** to any other "OLD STYLE" or "REDIPPED" plate made. A sample box will substantiate our claim.

McCLURE & CO., Pittsburgh, Pa.

APOLLO BEST BLOOM

is the brand of galvanized iron that is true to gauge, flat (does not buckle), and is uniformly workable (bends without weakening).

GALVANIZED IRON

A first-class worker in galvanized iron knows, to his cost, the difficulties, in exacting work, imposed by refractory metal and sheets not flat, and the losses incurred through varying thickness.

EVERY SHEET GUARANTEED

The extra cost is too small to appear in small sales. The actual cost of his job to the worker is less, if well done

Vertical Water Ways.

Double Corrugated Fire Box.

For HARD or SOFT COAL.

MR. WILLIAM J. BALDWIN, M.E., the HEATING ENGINEER, of NEW YORK, says in his trial of THIS boiler:

"The equivalent evaporation per pound of combustible from water at 212° Fah." "to 5 pounds pressure of steam is 11.02 pounds of water."
"The equivalent evaporation of water from 212° Fah. to 5 pounds steam pressure," "per square foot of average boiler surface per hour, is 2.368 pounds of water."
"You will note that when the rate of combustion is equal to 5 pounds of good an-" "thracite coal per square foot of grate per hour, that one square foot of average boiler" "surface evaporated sufficent steam for 10 square feet average radiation; an exceed-" "ingly high efficiency and rarely obtained in practice."
"The low temperature at which the gases of combustion entered the chimney," "ranging from 3 to 21 degrees above the temperature of the steam, shows that the" "boiler utilizes about all the available heat of the fuel."

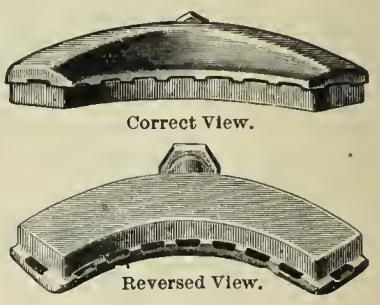
ESTABLISHED IN 1847.

ECONOMY

AIR BLAST ATTACHMENTS.



This cut illustrates our new Air Blast Ring, designed to fit our Regular, Double Radiator, Low Down, Tropic, and 1895 Patterns. Continued tests have proven the thorough adaptability of this appliance to apparatus for burning soft coal. It has many features worthy of the careful investigation of the trade. We cannot tell all about it here. Send for advance circular describing it.

This cut shows a transverse sectional view of the ring. Notice the slot. It is patented. Our circular tells why.

These two views show our Sectional Air Blast for any pattern. The use of it stimulates the burning of hard fuels.

Correct View.

Reversed View.

Facts of Interest to the Public.

Our "PROCESS" for 1895, we can say unqualifiedly, is the

MOST PERFECT WORKING

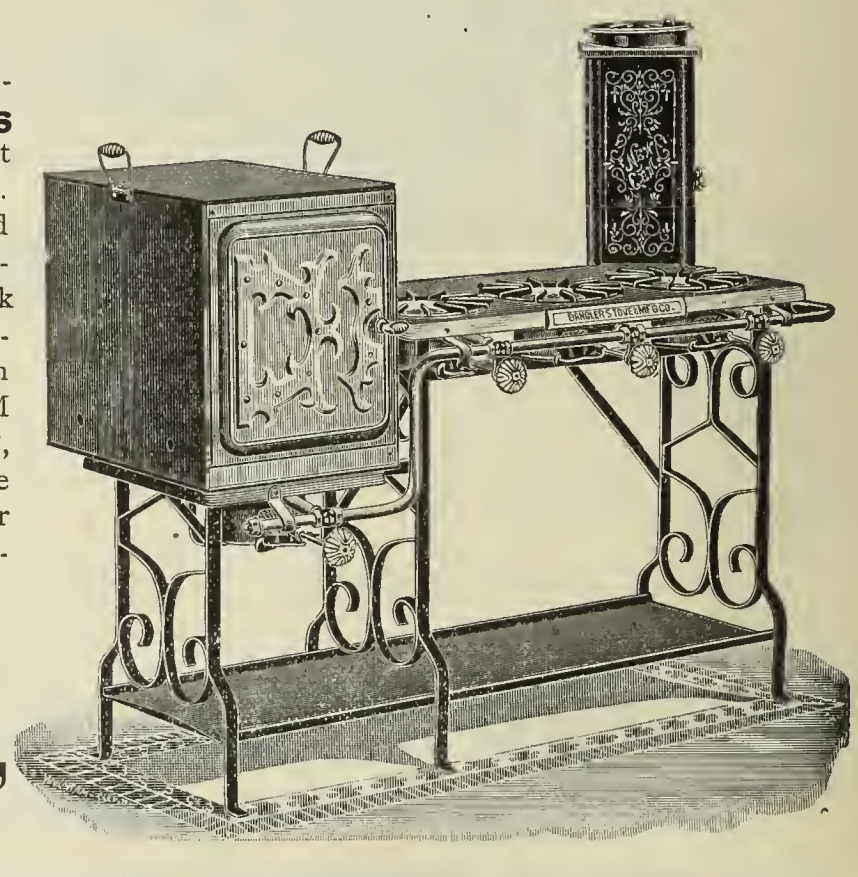
PROCESS STOVE EVER PLACED ON THE MARKET, and HAS NO EQUAL.

In calling attention to our

NEW GEM STOVE,

We offer the trade a STOVE FOR THE PEOPLE and FOR THE TIMES.

THE GEM STOVE is CONVENIENT



in SIZE, with the same sized flame as the PROCESS doing the same amount of work with **less fuel,** and at an original cost of only about ONE-HALF that of the regular high Stoves. This Stove is ABSOLUTELY our own, and CAN BE MADE ONLY BY US, and as pioneers in this business, the public naturally look to us for progress, while some of our competitors, who can only make the old line, call such improvements, "an innovation." Our GEM and PROCESS, together with our DELIGHT, celebrated JUNIORS, Individual and Single Generator Burner Stoves, &c., will give our trade a decided advantage over their competitors.

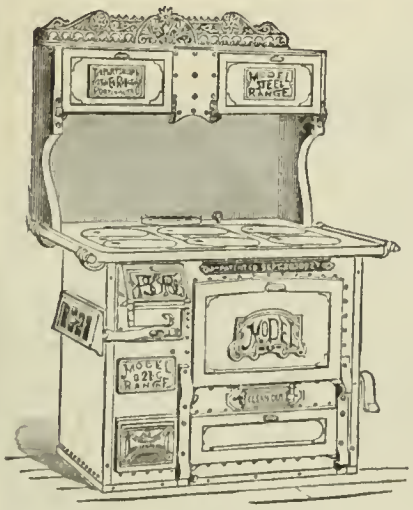
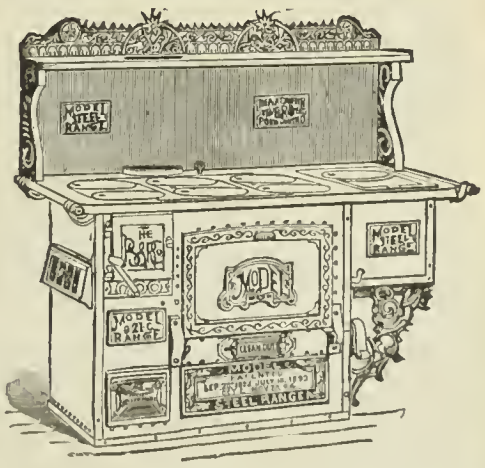
CHARLES NOBLE & CO.,

PHILADELPHIA.



THE ANNOUNCEMENT in a recent issue of THE METAL WORKER that we are soon to place on the market a Steel Climax Range having prompted the inquiry on the part of some of our patrons as to whether we design thereby to abandon the manufacture of our Celebrated Standard Climax Range, which has maintained supremacy for several years as an established leader of its class and against which not a single complaint has been filed in our office, we desire by this to inform the trade that the reputation of the Climax Range and constantly increasing demands for same is such as to preclude the possibility of abandonment if we felt disposed to do so. The Range, we are pleased to say, is more popular than ever, and the manufacture of same will be continued in all its varied conventional styles and sizes, and we sincerely trust that none will be deceived into a belief that an ***imitation*** now being offered to the trade is as good as the initial construction, which can only be procured of

TAPLIN, RICE & CO., AKRON, OHIO.



BEHOLD! The Leaders.

You can't see the others—
too far behind.

THE "MODEL" STEEL RANGES

have done more to popularize Steel Ranges than any other one factor. Why? Because they are absolutely the best, and the price brings them within the reach of all.

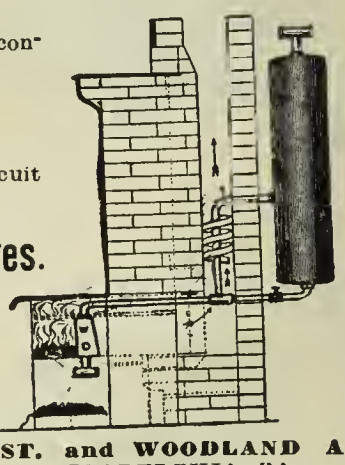
GLENMORE

Spiral Hot Water Generator.

(PATENTED.)

For General Heating Purposes, but Especially Adapted to House Heating.



COMMENDATORY POINTS:

Simple construction. Practically composed of two sections, consequently few joluts and nothing to give out.
Large heating surfaces.
Products of combustion fully utilized.
Instantaneous generation of hot water.
Free and easy circulation.
Easily cleaned fire surfaces.
Hot water may be drawn off at any point along the pipe circuit without materially affecting the heating service.
Grate conducive to economy in fuel.

Spiral Water Back Attachment for Kitchen Ranges.

By utilizing waste heat, this water back extends the capacity of a kitchen boiler, and makes it a valuable heating auxiliary, especially in spring and fall, when the regular heating apparatus is too powerful.

Welcome Stoves and Ranges.

KERNAN WELCOME RANGE.

Two Sizes, Portable or Brickset Nos. 7 and 8. Made with Oven either Right or Left of Fire Box.

WE HAVE embodied in this Range all that years of experience can suggest, both in ornamentation and construction. The design is unusually pleasing, with large Top Surface, large Fire Box and Oven. We furnish with Duplex, Dockash or Plain Flat Grates. Our Fire Box is so arranged that the grate pulls out through the front opening without disturbing the water back or brick, Those who have repaired old style ranges will appreciate this improvement. Sheet Flue of ample size. Guaranteed a quick baker and worker. Hot air for upper rooms is drawn from base and back of Range without interfering with the water back or Baking of Stove.

The Progressive dealers in Stoves and Ranges will find it wise to investigate and secure the sale of this modern Range. Write for Circulars and Prices.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

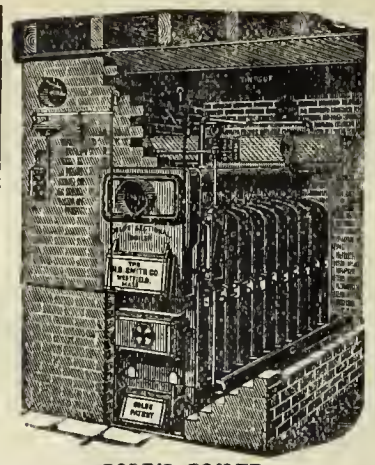
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER

71 Illustrations, 8vo, 140 Pages, Cloth

Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

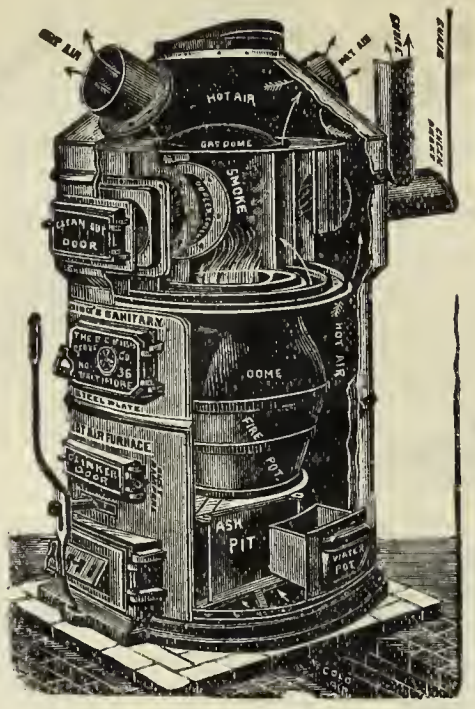
The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*



Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

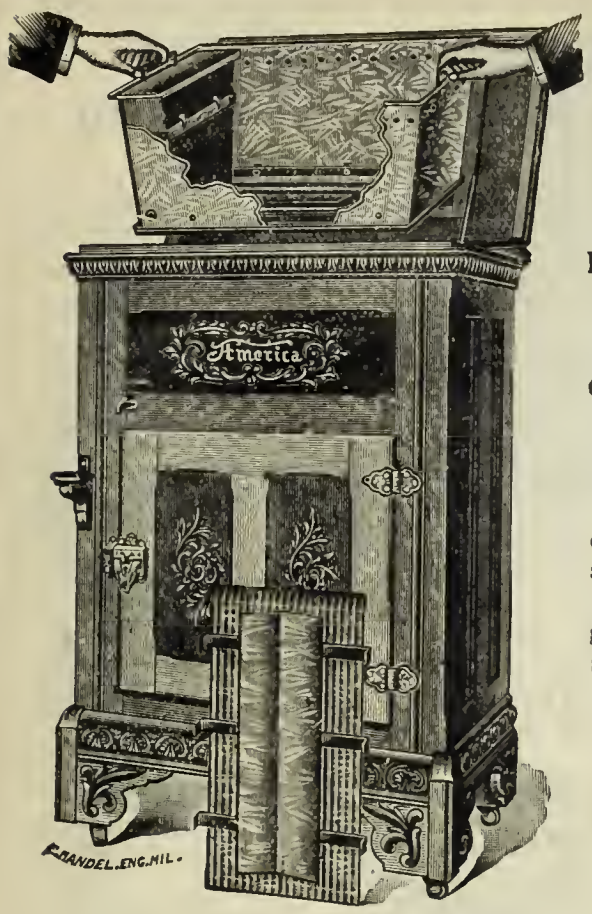
has more good points and does better work than any other and for that reason is a better seller. Our illustrated catalogue for 1895 te ls all about the line. Its advantages are:



Perfect circulation.
Large condensing and purifying capacity.
It has no flues to cause it to smell bad.
The trap is inside where it cannot be misplaced or lost.
The drip pipe may be cleaned without disturbing anything in either chamber, and is entirely out of the way.
It has nine walls to protect the ice and to maintain a uniform temperature in the cooling chamber.
It has woven wire provision shelves that are superior.
It has superior hardware.
It is more capacious and convenient.
Flavors of foods will not mix.
Last but not least, it's different, and will bring new customers and new trade.

We want the leading dealers to sell our goods and but one dealer in a place.
The goods are made of ash, and well finished.
We have two factories, one in the East and one in the West, and are able to take better care of your trade than if we had but one.

Some Curious Trees.

There are many vegetable wonders in this world of ours. Certain tropical trees furnish clothes as well as food, and the inner bark of others is smooth and flexible enough for writing paper. The bread tree has a solid fruit, a little larger than a cocoanut, which, when cut in slices and cooked, can scarcely be distinguished from excellent bread. The weeping tree of the Canary Islands is wet, even in a drought constantly distilling water in its leaves, and the wine tree of Mauritius Islands furnishes good wine instead of water. A kind of ash in Sicily has a sap which hardens into sugar, and is used as such by the natives without any refining. The product of the wax tree in the Andes resembles beeswax very closely. Then there is the butter tree of Africa, which produces as much as a hundred pounds at once, only to be renewed in a few months. This secretion, when hardened and salted, is difficult to distinguish from fresh, sweet butter. Closely rivaling this is the milk tree of South America, the sap of which resembles rich cow's milk, and is used as such by the natives. China can boast of a soap tree, the seeds of which, when used as soap, produce strong suds and remove dirt and grease readily. In direct opposition to the useful trees is the man eating plant of the tropics, which resembles Venus' fly trap in its nature. It has a short, thick trunk armed with narrow, flexible, barbed spines.—*Exchange.*

—A SMART WOMAN.—The lady from the back tier of counties was making her first visit in Washington, where all social business is conducted on strict rules, and one day she happened on a card of a Washington woman who lives in one of the largest houses in the town. In one corner of the card was the word "Thursdays," and she did't quite understand it.

"What is the 'Thursdays' for?" she asked the landlady of her boarding place.

"Oh, that means she is at home only on Thursdays," explained the landlady.

"My, my," exclaimed the visitor, "she must be a dreadful smart woman to be able to keep that great big house in any kind of decent order and only stay at home one day in the week. I don't go away at all, hardly, and mine ain't anything like so big as hers, but it don't give me a minute's rest trying to keep it clean and tidy."—*Detroit Free Press.*

—GENTLEMAN: "How came you to put your hand in my pocket?"

Pickpocket: "Beg your pardon. I am absent minded. I had once a pair of pants just like those you are wearing."—*National Standard.*

ART OF COPPERSMITHING.

A PRACTICAL TREATISE ON WORKING SHEET COPPER INTO ALL FORMS.

By JOHN FULLER, Sr.

Size, 10 x 6½ inches; 327 pages; 474 engravings. **Price, $3.00.**

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author has acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are 474, and which add much not only to the interest but the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details.

Fig. 107.—Planishing Tea-Kettle Side.

CONTENTS:

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea-Kettles; Oval Tea-Kettles; Beer Mullers; Funnels; Coffee Pots; Saucepans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set for Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

The End of a Strike.

The building trades strike in New York City has ended under an agreement which is virtually a defeat for the workmen. The union electrical workers, who claimed an eight-hour working day, have had this conceded to them from May 1, instead of May 15, a matter which might probably have been arranged at first by reasonable methods. This is the full extent of their gain. Beyond this, the union has been obliged to agree that its members who went back to work before the strike was off shall suffer no penalty, and that the non-union men who took the places of the strikers shall not lose them. Thousands of other workmen in other branches of the building trades who, generally against their own inclinations but in obedience to the orders of their autocratic rulers, the Board of Walking Delegates, struck in sympathy, get nothing at all. In other words, numbers of the strikers have not only lost a month's wages, but find themselves left without employment. Thus once more has a strike entered into without sufficient justification signally failed of its purpose. What have been the consequences? Serious pecuniary loss has been suffered by both parties to the dispute; great inconvenience has been imposed upon a large portion of the community by the stoppage of building operations for a month; ill-will has been engendered between employers and employed; and, at the end, a number of intelligent and industrious workers have lost their positions and find themselves and their families reduced to destitution. All this is not offset by any corresponding good, either monetary or moral.

Why It Failed.

This is merely a repetition of the lesson which has been read over and over again within the last few years—a lesson, however, which seems hard of apprehension by labor organizations. The lesson is that a strike to be successful must be scrupulously justifiable. This one failed because it was wrong. The electrical workers had agreed to a ninety days' notice of any demand for a change in the terms of their labor, and they overrode this contract. As to the other workmen, even granting that the electrical workers had a grievance, they had none, and their so-called sympathetic strike was as entirely unwarranted an action as was the Debs railroad strike to coerce the Pullman Company last year. Strikes of all kinds are becoming so frequent, and are undertaken nowadays on such flimsy pretexts, that the public has but little sympathy left to bestow on the strikers, even at the best of times, and none at all in the case of unjustifiable strikes, such as was this one. Public sympathy, in the case of sympathetic strikes, is exclusively with those who are dependent on the misguided men and who suffer from their actions; not at all with the men themselves. This is particularly the case when workmen permit themselves to be led into wrong and foolish actions by submitting their independence to a board of walking delegates, a class which thrives on labor disturbances such as these. One gratifying feature of the late building trades strike should, however, be recorded. It was unaccompanied by a single act of lawlessness or riot. In this respect it will compare favorably with many recent troubles of the kind.

Some Signs of Improvement.

To the country at large it must be an unspeakable relief to note the signs of improvement which are multiplying on the business horizon. The developments of the past two weeks have been almost uniformly in the direction of encouragement. They point to a revival of confidence, that all-important factor without which no return of prosperity can be secured. Trade and industrial reports are more favorable. Railway traffic returns, which made so poor a showing in the blizzard month of February, exhibit so far for the current month a distinct improvement. The bank clearings last week showed a material increase as compared with last year's figures, indicating a growth in the volume of general business. Wall Street has taken the lead in the upward movement, stocks and bonds having experienced accession of strength and activity. Prices of securities are advancing steadily and uniformly. The investing public is again largely in evidence as buyers on "the street," having apparently reached the conclusion that affairs, both financial and commercial, have, since the departure of Congress, entered upon a safer stage and one from which the disturbing influences which have affected the markets for the past two years have been removed. The money market is hardening, and foreign exchanges are easier than for some time past. Silver is rising in value, and the markets for grain and cotton have advanced in a manner which would have been thought most improbable a short time ago. Recent heavy foreign buying of our railway securities indicates the beginning of a movement to repurchase at least a portion of the immense volume of stocks and bonds sent back to this country from Europe since the Baring panic. A large increase in the importations of merchandise reflects the belief on the part of merchants that there will be a brisk spring trade. In short, all signs point to the beginning of a recovery which, if, somewhat gradual, promises to be continuous. It is true that the gain in general business is slow as yet and its volume materially below that of a year of average prosperity; but it is growing, and gives promise of considerable expansion in the coming months.

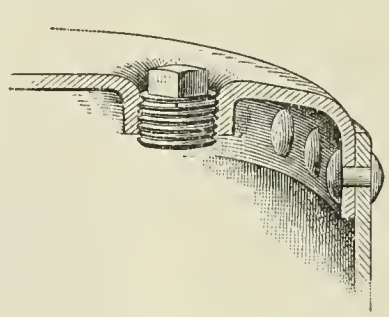
Church Heating Plants.

It is probable that the weather of the past winter made more extensive repairs necessary in church heating systems than in any others, and whether the systems were steam, hot water or combination, the effect was the same. The most severe effect of the weather coming at the middle of the week, many church heating plants were without fire, no fire having been necessary during the previous portion of the season to prevent their freezing. On firing up late in the week for the next Sunday the damage sustained was discovered in many cases too late to be repaired in time for use on the following Sunday. In some hot water jobs every radiator in connection with the plant was frozen and burst, and in some cases every section of the radiator. The damage was not confined to the radiators alone, but both the flow and return pipes and the fittings succumbed to the frost. In steam plants where the condensation did not return to the boiler owing to poor piping or want of air valves, the plants were rendered unfit for service by ice bursting pipes and radiators. In churches where combination apparatus was used some difficulty was encountered in explaining that the water heating apparatus would be ruined if the furnace was run, though in some cases the risk of its destruction was taken in order to have service. It requires more judgment than is possessed by the average sexton to say when the fire shall be run to prevent freezing, and the extra labor of emptying and filling the system as a precaution is seldom undertaken.

THE LETTER BOX.

Are Gravel Roofs Durable?

From G. F. WHEELOCK, *Birmingham, Ala.*—The correspondence started by "G. D. B." in *The Metal Worker* February 16 in reference to tin and gravel roofing has opened up a very interesting question, and to me personally it resulted in a very pleasant correspondence with "G. D. B." of Greenville, S. C. I have had a couple of communications from him, and from his statements of conditions and results I give him credit for being perfectly honest in his assertion that he can put on a good tin roof for $4 per square and make money. But while those conditions exist there I have never met them in any other part of the country during my travels, which cover the Eastern and Western States and this portion of the South. In regard to the relative cost of tin and gravel roofing, I would base the price of a good tin roof laid on sheathing paper and finished with two coats of good paint at $7.50 per square, with a resultant profit to the roofer of $1 per square. Admitting that this roof with slight repairs and a coat of paint every two years at a cost of 75 cents per square will last 20 years, we have a total cost during its life of $15 per square. Now, we must bear in mind that to attain this result the roof must be looked after every couple of years. If this is neglected and the roof is allowed to rust, it will, of course, proportionally shorten its life.



Now, as to the gravel roof, I will base my price at $4 per square for a four-ply coal tar pitch composition roof; this will give the roofer $1 per square profit. This roof will last at least for ten years, when it can be replaced at the same original cost, making the total cost for 20 years $8 per square and requiring no attention during the life of the roof. To attain this result the material and work must be of the best; and in this connection I wish to say that there has been a great improvement in the manner of doing gravel roofing in the past few years, especially the substitution of metal for the old style felt flashings and metal eave strips for the wood strip. Right here, in my mind, is the vital point, in connection with composition roofing. Any portion of the roof where it is not possible to protect the felt, on account of the position or shape, with gravel should be covered with metal, for as long as the felt is perfectly protected the roof will last.

In the laying of a good composition roof a good grade of tarred felt, weighing not less than 2½ ounces to the foot, should be used. Care should be taken that there is not less than four thicknesses at any part of the roof, well stuck together with hot pitch. In finishing the top surface with gravel, which should be not larger than ½ inch and free from sand, the pitch should be poured and not applied with a mop. To put on a roof in this manner will require about 100 pounds of pitch to the square. While I base the probable life of this roof at ten years, if asphalt properly prepared is substituted for pitch and the felts are saturated with asphalt instead of coal tar, I will place the life of the roof at 25 years, and I believe this a safe limit.

I apply a roof of this kind here, for which I charge $7.50 per square, same as first cost of a good tin roof, painted, and as between the two there is no comparison. To show the value placed upon this roof by one of my customers, who has used the same roof on his buildings in St. Paul, Minn., he says he would rather have it at same cost than sheet gold. While I hardly agree with him on this point, I do believe that asphalt, when properly prepared and applied, is the best roofing material for flat roofs in the market, copper not excepted. Coal tar pitch in time by exposure loses its oils, becomes brittle, the gravel is loosened, the felt is exposed and rots. Asphalt is not affected by exposure to the atmosphere, does not become brittle, and consequently holds the gravel securely in place. I notice that some roofers are in the habit of using pine tar pitch. This becomes very soft in summer and very brittle in cold weather, and I do not believe it possible to do good work with it.

Mending a Boiler.

From H. J., *Camden, N. J.*—About four o'clock in the morning of the day before Christmas I was called to the

Mending a Boiler.

house of one of my clients whose kitchen was nicely flooded with water. I immediately turned off the water in the cellar and found a hole in the top of the boiler from which water had been spurting until it had washed the paper off the ceiling for a space 3 feet square. The head of the boiler was of wrought iron, stamped up into a dome shape. I reamed out the hole almost large enough to receive a ¼ inch tap. Then with a tapering punch or drift pin, which I drove into the hole, I enlarged it sufficiently to receive the tap, at the same time forcing in the metal and increasing the surface which would bear on the tap in cutting the thread. After threading the hole I inserted a plug and stopped the trouble. The sketch I send shows the way it was done. I found two other small rusted spots on the top of the boiler which I have told the owner will eventually become leaks. This is not my first experience with holes of this character in a galvanized iron boiler. I have put eight plugs in a boiler in the house of one of my customers, and have found that a galvanized iron boiler will frequently show a tendency to rust out in spots in from four to six years. Sometimes they last longer—to 12 or 16 years—but in my experience I would consider a galvanized boiler that had been in use 20 or 25 years without developing any of these rust spots, which eventually become holes, as one of extraordinary durability. I thought that this experience and method of mending a boiler might be of interest to some of your readers and have sent it in.

Lining Tanks With Lead.

From S. K., *Grand Rapids, Wis.*—I would like to get from *The Metal Worker* or some of its readers some information about lining tanks with sheet lead. Is it necessary to tin the edges of the lead when round irons are used, and how is the solder put on?

Note.—In lining tanks with sheet lead where round irons are used the seams are generally wiped. In preparing the lead it should be laid out on a clean, smooth floor. A piece of lead about 3 inches wide and 10 inches long, one end curled in a circle for a handle, is used to pat the lead smoothly all over. After this is accomplished the lead is cut in sizes that will make the least number of seams in the tank, and if possible these seams will be brought into the corners in all cases. The edges of the lead from ¾ to 1 inch each side of the seam should be cleaned bright with the shave hook. The lead beyond this cleaned line may then be covered with soil to prevent the solder extending beyond the seam, or if strips of paper are pasted along, using good flour paste, the same service will be rendered. The lead lining after being prepared is placed in the tank and the method of securing it depends upon its size. In some cases, as with a small tank, it will only be necessary to turn the edge of the lead over the edge of the tank and secure it with nails. If the tank is large it will be necessary to fasten the lead at regular points in the tank by means of what is known in the trade as a bull's-eye. The bull's eye requires a concave surface to be made in the wooden portion of the tank about ½ inch deep and 2½ or 3 inches in diameter. After the lining is in the tank it is beaten smooth into these hollow spaces with a piece of sheet lead and fastened with a screw or nail. Then its inner surface is scraped clean and bright with a shave hook, and the space around it either covered with soil or paper pasted on to prevent the solder splashed against the bright surface in tinning it from adhering beyond its space; then, with a wiping pad, the space is wiped flush with solder. This makes a very firm support to the whole lining. The

lining having now been adjusted in the tank and secured by nails at intervals of 4 to 6 inches along the seams, the wiping of the seams can be commenced. With a large pot of solder at the right temperature it should be splashed along the seams and wiped with the pad until the bright places are thoroughly tinned and a sufficient quantity of solder placed along the seam to permit of a good strong seam being wiped. Here is where the round iron is brought into use. As the solder has been splashed on the seam with a splash stick and ladle, the pad should be used to keep the solder in a heap in the center, and naturally it would cool to an extent that it could not be wiped, as a space of 2 or 3 or more feet, according to the skill of the operator, will have been prepared. The seam, however, being well heated and the solder almost in a condition for wiping, the red hot round iron is moved along the seam until the whole mass is again in a fluid state; and while in this condition a clean pad, to which some tallow has been applied, is used to finish the seam. On horizontal seams little difficulty will be experienced, but in the upright seams more trouble will be found. But if the workman is skillful, there is no great difficulty in completing a neat, strong seam, with the metal at a sufficient heat to fuse thoroughly and not to be porous so as to leak.

Collapsed With a Vacuum Valve.

From S. J. L, *Catasauqua, Pa.*—My opinion as to the cause of the coffee boiler, referred to by "M. A. C.," Petoskey, Mich., March 16, collapsing, is that the vacuum valve should be on the hot water pipe and not on the cold pipe (or supply), as the hole in the delivery pipe is usually small and is liable to be closed by sediment. I have had considerable experience with copper boilers, and have found that the hot water pipe is the place for the vacuum valve, the reason for which is clear.

Inside Cold Air Duct.

From B. REESE, *Odessa.*—I notice the inquiry from "Spec. Spencer" in *The Metal Worker* of March 16, and having had no experience with inside cold air ducts would ask some of the Northwestern furnacemen to supply the information. I know that in Nebraska and Dakota the use of an inside cold air duct is quite common and necessary, as the outside air is frequently driven along at the rate of over 30 miles an hour and at a temperature of as much as 35 to 40° below zero, and under such circumstances it is quite probable that it would pass through the furnace without being properly heated, and as a consequence the building would not be comfortably warmed. Whether or not some cold air is taken from the outside when the inside duct is used is a question I should like to have answered. It is stated by some authorities that an ordinary window leaks 8 cubic feet of air per minute, and if only inside air was used leaks to this extent would provide ventilation, but in that section of country double sash are used for the purpose of preventing leakage of air and also of the too rapid cooling of the air in the room by the excessively cold temperature of the air on the glass, so that little ventilation could be depended upon under such circumstances from the windows. I should not desire to live in a house where the furnace had no other source of air supply than from the house itself, for while a revolution of the air in the house tends to economy in heating it provides no ventilation, which I consider of great importance.

An Engineer's Education Wanted.

From J. S., *Omaha, Neb.*—Please give in *The Metal Worker* a method and scale for finding how much radiation will be required to heat a room, for example, 50 x 22 x 13. What would be the best way to set the radiators? Please give a scale stating how many square feet of radiation is exposed in 1 foot of wrought iron pipe from ⅛ inch to 2 inches. Give the tables for radiation for both steam and hot water heating. What per cent. of increase in heating surface is allowed in frame buildings over brick or stone buildings? Is there any difference in the allowance made for walls, doors and windows?

Answer.—The secret of successful heating may be truly said to lie in calculating the amount of heating surface required for different buildings, and the information desired by our correspondent covers too much to be treated in a limited space. He will find a chart for calculating areas and cubic contents that will be of some service to him in *The Metal Worker* of December 8, and an article that tersely covers the subject in which he is interested will be found under the head of Hot Water Heating in *The Metal Worker* of March 2. To get the best rule on the subject about which he makes inquiry he should read some of the books that are published in reference to it. Among those that we recommend are "The Metal Worker Essays on House Heating," "Steam Heating for Buildings," by William J. Baldwin, and "Hot Water Heating and Fitting," by the same author.

The room mentioned contains 14,300 cubic feet, and in hot water heating it might be safe to calculate on one square foot of surface heating to 30 cubic feet of space; therefore 480 square feet of radiation would be required. In steam heating one square foot of surface might be used to heat 50 cubic feet of space, and 285 square feet of radiation would be needed. In hot water heating for houses or smaller rooms one square foot to 25 or 30 cubic feet of space, according to the character and exposure of the building, is used; and in steam heating work one foot to 40 or 50 cubic feet of space is generally used. One square foot of glass surface, as it is exposed in the window, is supposed to have the same cooling effect as 10 feet of ordinary wall surface. To be able to use the rules they should be read in full and studied at some length, and then applied with considerable judgment to secure the best results. The surface exposed in different sizes of pipe is given in almost all price-lists of pipe and in the books recommended. Radiators should be set in front of a window in preference to any other location in a room.

A Detail of Construction.

From A. S. R., *Saratoga Springs, N. Y.* — Would you kindly inform us through *The Metal Worker* if expanded steel flues in a cast iron house heating boiler head are more likely to leak from unequal expansion than when in a steel head? Is an all steel boiler shorter lived than an all cast iron one? We claimed that an expanded flue is the most sensible of any system of flue connection, as all high pressure boilers and locomotive boilers are put together in that way. We would like to hear the opinions of the experts on this matter.

Note.—The form of connection in most general use is of the expanded flue character; and we should prefer to have our practical readers report as to which of the two flue connections mentioned is more desirable. The durability of boilers is a question on which opinions differ, the popular opinion being that as a house heating boiler is not in use in summer a wrought iron boiler suffers more than the cast iron boiler under the same conditions. Wrought iron boilers have been in use for power purposes for more than a quarter of a century; and an all cast iron house heating boiler that was installed in a residence in 1859, doing constant service until 1894, is now doing service as a radiator in the salesroom of a heating contractor, and is apparently in good order.

Quality of Tin Roofs.

From G. L P., *Kentucky.*—The boss takes *The Metal Worker* and I find it both interesting and instructive. The views of your correspondent in the issue of March 9 on the quality of tin roofs struck the nail square on the head, and to make his article complete I would add that the tin plate factories now in operation and in contemplation in this country are doing more to kill the goose than all other agencies combined. In the first place, by seeking cheap metal and cheap methods of manufacturing tin plate, nine-tenths of them are turning out a miserable quality of plate, and in a few years, at the pace they are now going, their occupation will be like Othello's, for the simple reason that consumers will have to look for some other material for roof covering than tin or terne plate, so that in a short time it will only be a question of the survival of the fittest. When I look out of the back window of my shop I can see within a few feet of me a tin roof that I put on 25 years ago that is as sound to day as the day it was put on, and a very flat roof at that, and when I look out in another direction I see another roof that I put on but a few years ago that is leaking on account of rusting out, then I am forced to the conclusion I have expressed. I have been using American plate for the past two years and find it uniformly poor in quality, although I bought the highest priced goods in the market. The thing in a nutshell is that our tin

plate manufacturers are killing their products with acids and making use of black plates unfit to be coated.

Sheet Metal Launch.

From Louis Giclas, *Washington, D. C.*—As the inquiries continue to come on concerning the sheet metal launch, a description of which appeared in *The Metal Worker* of November 10, I wish for the benefit of the readers of *The Metal Worker* as well as myself you would publish the state ment that I will not furnish any more drawings and specifications for the launch. All information concerning the motors can be obtained by addressing the Sintz Gas Engine Company, Grand Rapids, Mich.

Is Trap Ventilation Necessary?

From A. B. K., *Burlington, Vt.*—There has been some discussion here relative to the ventilation or back airing of traps. I claim that there is no advantage in the practice except to prevent siphonage; and where there is no danger of the trap being siphoned by the use of some other fixture or other means, it is better not to run any back air pipe to make the drainage system complicated. This is an old question, but is one that is not fully settled here; and I would like the testimony of the best authorities on this point.

Note.—English writers on this subject all agree that every trap should be ventilated. This subject has been treated in the works of W. P. Buchan, P. J. Davies and S. S. Helyer. The Board of Health of New York City in preparing the plumbing code of the city decided that such pipes were necessary. The opinion of these authorities, however, is not accepted by some eminent plumbers, who entertain ideas similar to those of our correspondent. We should be glad to have this subject discussed.

Trouble with Furnacemen.

From Sanitary, *Connecticut.*—I have read the letter of "Tinsmith" in *The Metal Worker*, March 23, and considering his job from a humane standpoint, I see nothing to be proud of. Commercially he is to be congratulated on having heated the house; but can it be considered to be a sanitary job? The old proverb for health is to keep the head cool and the feet warm and, if I mistake not, he has reversed the conditions. How can the floor of a house be warm if the cellar is used as a cold air chamber? What kind of a place is a cellar to live in? Is the air that comes from a cellar any better because it has been superheated? Would it be possible to get a temperature of 94°, 8 feet from a register, if it was not superheated? Will not the air to warm a given room have to be very much hotter if the pipes are small, as he recommends? His recommendation on comparing with the job shown March 2 amounts to reducing the pipes 1 inch in diameter. A 7 inch pipe compares with an 8-inch pipe as 49 compares with 64, a reduction of one fourth, to be made up by increased temperature and velocity, both of which are wrong from a sanitary standpoint. Increased temperature means more frequent action of the lungs to get the required oxygen. Increased temperature means a dryness of atmosphere that parches the skin and membranes to irritation, coughs and inflammation. Increased velocity means drafts on the body to effect evaporation of moisture, causing a tax on the system that is paid by indispositions. How much ventilation could be ventured upon with so little inflow of air? How many changes of air per hour could be had with such small pipes? The furnace mentioned is small and would have to be run hard, to its detriment and to the delight of the coal dealer. The recommendations made are in a commendable spirit to help a brother and many may differ with me, but I think they reflect more of cheapness than of progression. The furnacemen are sneered at by other heating men and it is largely their own fault. They have followed a rut and let price govern their practice till, taken as a whole, there is less in it to be proud of than there should be. Instead of following the suggestions given the trade should advance. The underlying principles should be studied and aggressively pushed. How many furnacemen really say what the heating arrangement should be? They are so few that they are lost to sight. The veriest hatchet and saw carpenter dominates over the furnaceman and tells him: "What I say or nothing." No matter how little he knows, what he says goes. Owing to the character of furnace work, as a whole, other methods of heating that are far more expensive and not to be compared with an ideal job of furnace work are supplanting furnaces, though in effect they have little but novelty to recommend them. Furnacemen, wake up! Let us educate our less competent brothers to a higher standard and maintain it.

Boiler Siphons.

From W. C., *Paterson, N. J.*—Will some reader of *The Metal Worker* explain why water is siphoned out of a boiler which is used for heating purposes?

Note.—If more information as to detail was given in this inquiry, it is probable that a more satisfactory answer could be furnished. We assume that a boiler has been set in a room above the kitchen in order to heat the room, and that but very low water pressure is found in the system at some portion of the day. Then by opening the faucets below the boiler the water is siphoned out. It is possible that the delivery tube in the boiler has no hole in it at the top, or that the hole is stopped by sediment which causes the trouble.

A Peculiar Furnace Experience.

From C. S, *Cleveland, Ohio.*—Answering article of E. E. Palmer, Harrisburg, "A Peculiar Furnace Experience," in *The Metal Worker* of March 16, will say that he points out the cause of our trouble at fire place flue. We anticipated the trouble there ourselves, stopped it up and made a trial with no better results. In regard to the cause of objectionable drafts at present in the rooms that we endeavored to obviate, we know that a good portion is due to large glass surface in bay window. The room is never closed off; sliding doors are left open at all times. We also note what Mr. Palmer says about too much ventilation in fire place and not being able to warm certain rooms; we have had cases where we could not warm certain rooms until we opened fire place flue. The sketch shows the cold air register placed at the northwest end of room, and if leaks do occur at windows it seems to us the leakage should act as a damper at least on the cold air register, and not allow hot air to rise from it. This is quite a puzzling and peculiar experience to us, for we are at a loss to know why it does not work, having a fall of about 8 feet to the furnace. We would be pleased to hear from Mr. Palmer again through the Letter Box.

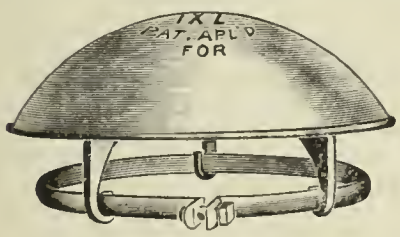
In answer to article of "R. S.," Brooklyn, N. Y., will say that he seems to be of the same opinion as our friend Mr. Palmer of Harrisburg, and that the fire place is the cause of our trouble. We have experimented there to no avail, shut off the faucet, so to speak, but did not stop the leak. Will "R. S." be kind enough to let us hear from him again?

From H. R. D., *Brooklyn, N. Y.*—I see in *The Metal Worker* of March 9 an article from "C. S." about a peculiar furnace experience, and in my opinion it is so peculiar that I do not wonder at it not working. I think the brick casing of the furnace is not properly constructed. It should be made of two chambers, an inner one inclosing the furnace proper, with openings at the bottom through which the air enters to the furnace, and an outer casing inclosing the inner casing with a space between the two and receiving the cold air supply at the top of the outer chamber. This cold air receives some heat in passing down by the inner casing and enters the air spaces at the bottom to the furnace radiators. "C. S.," has no inside chamber to his furnace, which he should have. The mason work of the inside chamber should be well pointed and the joints tightly made and then whitewashed, as bricks absorb and give off a great deal of heat. The inside chamber should also be lined with tin. He introduces his cold air at the wrong place. It should be at the top, and the cold air pipe from the room in question should be connected in the same manner. This done, I see no reason why the furnace should not work properly if the furnace is large enough and it is set properly.

Which Is Best for Furnace Tops?

From J. C., *Cleveland, Ohio.*—Answering "T. O. M.," Adams, N. Y., on "Which is the best for furnace tops?" in *The Metal Worker* of March 16, will say that the cold air in question is taken from inside the house in a reception hall under stairway opening, being 27 x 27 and cold air duct the same. The rooms that give us trouble open into this hall both first and second floors. Off the furnace are taken four 10-inch and four 9 inch hot air pipes. From the above it will be seen that our air supply is ample. The furnace is centrally located, and we are sure it is not in the air supply. We would be pleased to hear from "T. O. M." again on the subject.

A strike of seamen at San Francisco for $5 a month increase in wages has been met by the shipping of Japanese crews.



PLUMBING and GAS FITTING.

Open Work Fixtures.

In the large cities it is noticed by real estate agents and others who have property to rent that special favor is shown to dwellings where open work plumbing fixtures are used. This demand has been gratified for a long time as far as lavatories and water closets were concerned, but the economical disposition of the builder has held him to the wood incased bath, although persistent effort has been made to introduce cast iron baths and sheet metal baths of different character. It is claimed by those who are doing the work that the people are now demanding an exposed bathtub, and the manufacturers of such goods are constantly increasing their output to meet the demand. It is claimed that it is easy to sweep and clean around such fixtures, as there is no hidden space for an accumulation of dirt of any character. Various goods are made to meet these requirements, and plumbers will do well to keep informed of all the different kinds.

The I X L Vent Cap.

The accompanying illustration shows the I X L vent cap made by the Zero Valve Company, 304 Seneca street,

The I X L Vent Cap.

Buffalo, N. Y. It is made of malleable iron, and can be attached to any piece of waste soil pipe without calking and joined by simply adjusting a set screw, as no hub end is required. A wrought iron band clasps the pipe and is tightened to suit the size of the pipe. It is intended to cover the fresh air inlet or the top of the ventilation pipe above the roof.

Sanitary School Buildings.

It is quite possible that the following report to the School Board on the Mt. Pleasant school building at Nashua, N. H., by Irving A. Watson, secretary of the State Board of Health, is applicable to the buildings in many other cities.

The plumbing is faulty in several particulars and should at once be reconstructed. The effects in this respect are apparent to any one cognizant with what constitutes good plumbing. The service is deficient in traps and trap ventilation and defective in construction. The soil pipe should be ventilated into the open air above the roof instead of into the chimney flue. This pipe should be of iron, with perfectly tight joints. The present pipe, constructed of sheet iron, with loose joints, is dangerously defective, and should be remedied at once.

In my judgment, the conditions which are the most dangerous to the health of the pupils consist in the so-called ventilating system and its attendant evils. A plan like this, which provides the several rooms with an outgoing flue, but entirely overlooks the matter of providing for the entrance of fresh air, is an inexcusable oversight or neglect in providing for adequate ventilation. With outgoing flues which enter the several chimneys there is, especially in cold weather, a constant though slow exhaust of air from the schoolrooms, to supply which loss there is a forced draft upon every crack and crevice in the schoolroom. In the winter, when the windows are closed and the building made as impervious to outside air as possible, these flues amount to practically nothing in the way of securing fresh air for the schoolrooms. By reason of the exhausting force of the air escaping through the chimney flues the suction is put upon all the crevices that will admit air, including the defective ventilating flues from the water vault, as well as, possibly under certain conditions, from the soil pipe itself.

The fact exists that under the present system any defective connection with the public sewer or any unsanitary condition in the basement of the building is exceedingly liable to endanger the health of the school children, because the actual exhaust of deleterious gas, &c., must necessarily be through the school flues. These conditions in themselves constitute an ever present menace to the health of the pupils, but it is by no means all.

Aside from what has already been pointed out, the system of ventilation is deplorable; in fact, it can hardly be said to constitute a system. It is conceded by physicians, sanitarians and engineers who have made schoolhouse sanitation a study, that 1800 cubic feet of air per hour per pupil is necessary in order to secure at all times a healthful atmosphere in the schoolroom.

Many authorities place the figures considerably higher. In order to secure such a condition, there must be ample flues for the admission of fresh air, as well as corresponding exhaust flues.

The present system is practically one of direct radiation, which simply heats the same air over and over. A schoolroom that does not receive the amount of air indicated above soon reaches a state which is regarded as detrimental to the health of the children by reason of the excess of impurities which soon accumulate by exhalations from lungs, evaporations from the skin, &c.

It is conceded that unless the ventilation is ample to hold the carbonic acid gas thrown off chiefly by the lungs to below 10 parts per 10,000, the ventilation is insufficient. It is desirable that the carbonic acid gas shall not accumulate to an extent of more than 6 parts per 10,000, and in order to maintain this degree of purity in rooms like those of your schoolhouse, it would be necessary to introduce constantly a large amount of warm fresh air during the winter season.

It is, perhaps, not necessary to elaborate this point at the present time. I only desire to impress upon your board the great need of better ventilation for this schoolhouse. I believe that its greatest sanitary defect is in the lack of ample ventilation.

Niagara Ejector.

The illustrations herewith show the Niagara ejector manufactured by S. J. Putnam, Princes Bay, N. Y. Fig. 1

Niagara Ejector.—Fig. 1.—General View

shows the ejector for use in urinal stalls, to be secured into the side of the flushing pipe, which passes across the stall. Fig. 2 shows the ejector with clamp for fastening to a slate slab when the supply pipe is run behind the slab out of sight. As may be seen from the cuts the lead supply pipe may be run to this extension and connected to it by a wiped joint. The ejector can be used

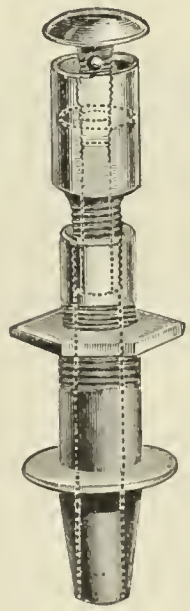


Fig. 2.—Ejector Arranged for Attaching to Slabs.

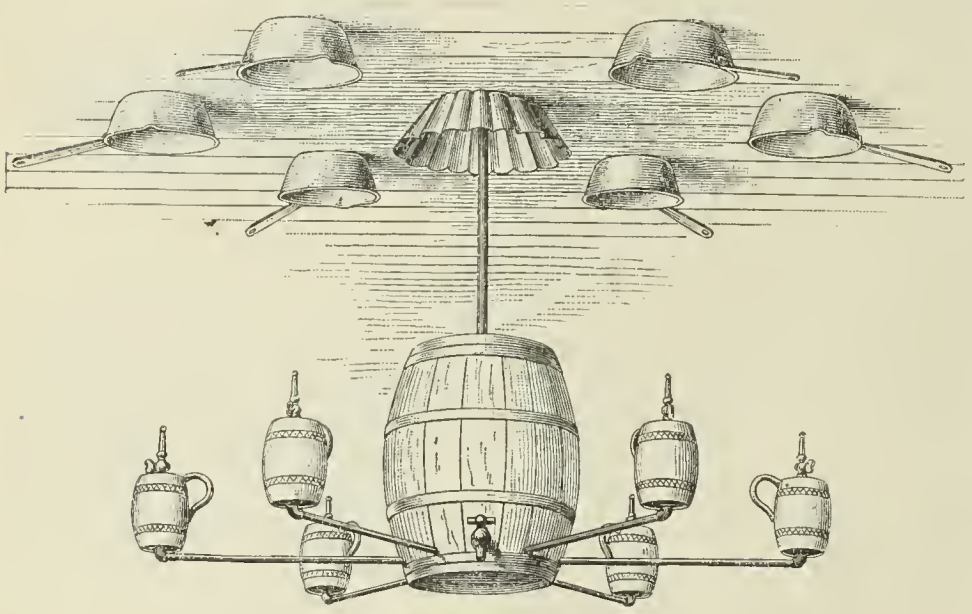


in connection with an automatic flush tank or owing to the small quantity of water used may be left to run continuously or operated by a stop cock. In operation a thin sheet of water is thrown against the slab through the slot opening as shown in Fig. 1. Fig. 2 shows the cap of the ejector partly removed and the hole through which the water is delivered. The seat against which the cap fits is cut away on the under

side for one-third the circumference so that the spray is spread. The force of the water at the outlet coming against the internal spherical head of the screw cap throws a thin fan shaped sheet of water against the back of the stall and over into the corners, flushing the entire surface.

A Unique Gas Fixture.

BY A VISITOR.

A guest of the Pen and Pencil Club of 1026 Walnut street, Philadelphia, finds considerable pleasure in being shown through their club house, the various rooms of which are adorned with mementoes of sporting, political and historical interest. No room, however, excites so great an interest and leaves so fixed an impression as the "Pirate's Den," from which is taken the subject of our illustration. This room is naturally rude and rugged in its finish and furniture. The ceiling and walls are made of slabs of natural wood, on which it is incumbent that

A Unique Gas Fixture.

each member shall carve his name, and no little artistic taste and skillful handiwork is displayed in fulfilling this requirement. Some are on the ceiling, some against the rafters, some run horizontally, others obliquely and a few are upside down. Seats are made of empty beer kegs, cushions being made of coils of rope. These surround a massive table, and the awful rules and regulations which govern all who enter this apartment hang conspicuously on the cupboard door. The den is lighted by a gas fixture. The pendant drops through a Turk's head cake mold of tin nailed to the ceiling and passes down into an empty "sextle" beer keg. Six branching arms radiate from the keg to the burner key. The burners pass up through stone beer mugs, having holes drilled through the bottom. Above each burner a bright tin stew pan is nailed to the ceiling, the handle pointing away from the center. This novel fixture is well adapted to its surroundings, and the brilliant light it sheds is no more brilliant than the repartee that passes between frequenters of this by no means gloomy den.

MAYOR COOK of Gloucester, Mass., has signed a new plumbing ordinance which is now in effect in that city. It calls for a water test, trap ventilation, local vents to closets, permits and plumbing inspection.

Thawing Frozen Pipes with Electricity.

Mr. Edmunds informs us, says the *Electrical Review* of London, England, that he has been making some experiments lately with most complete success in what we think is a new and important application of electricity to domestic use. He, like many others, has suffered the inconvenience of having his gas and water service frozen during the late severe weather. It occurred to him that a resistance, suitably protected, might be introduced into those pipes which were most exposed and least easy of access with flame or hot water or other ordinary method of thawing. He had a special wire made in which the current was conducted through a highly resistant metal, insulated with a fireproof medium that was also a nonconductor of electricity. The whole was inclosed in a metal tube, which could be drawn down to make a compact wire or tube that was externally a conductor of heat, but not of electricity, thus preventing loss of current and electrolysis. The results were most satisfactory. This "thermic" wire was introduced into the waste pipe from a bathroom at the north side of his house, which entered a fall pipe some 20 feet from the ground and which was easily frozen. The thermic wire was introduced from the outside. At night a small stream of water trickling down froze, forming an icicle some 12 inches long and 1½ inches thick, completely locking the waste pipe. The thermic wire having been previously connected with Mr. Edmunds' electric light circuit, at 50 volts pressure. when current was turned on 4 amperes flowed through it, and in four minutes a complete thawing was effected and the waste service was cleared.

Cleaning Solder.

BY OLIVER TWIST.

To make and to keep good solder it is necessary to be very careful as to what is put into the melting pot, for old lead pipe, lead tacks, &c., often contain zinc, antimony, copper, arsenic and other ingredients. Type metal is sometimes used under the impression that it is lead, whereas it is alloyed with 20 per cent. of antimony, which is as ruinous to solder as is zinc. If iron be contained in solder it is readily removed by stirring and skimming, as it is usually in the form of a powder or oxide on account of the high temperature necessary to fuse it, and never gives the trouble caused by other alloys. Sheet lead scrap or tea lead make good solder, and the failure to clean solder by the use of sulphur is often due to the fact that no tin, or not enough tin, is added after the process to make up for what has oxidized, and also to not removing the sulphur by the use of tallow.

Suit for Defective Plumbing.

A man in this town, says the New York *Sun*, brings suit against his landlord for damages for the loss of his daughter, whose death he attributes to the insanitary condition of premises occupied as a dwelling house. The principle governing a landlord's liability in these cases is well settled in England, but is hardly likely to be established in the same way in this country. The rise of the doctrine there is peculiar. The first suits were brought by landlords against tenants for non payment of rent, resisted by the tenants on the plea that the premises were insanitary.

There was a statute in existence designed apparently for the protection of the tenants, to which they generally appealed to sustain their side of the case, which, under the said statute, they generally lost, owing to its phraseology. But in the course of construing the statute the courts laid down a series of principles which soon combined to create a general case lying altogether outside of the statute. While this general case did not sustain the tenant in his refusal to pay rent, it did give him his action against the landlord for damages as to injury received in health through an insanitary condition of premises.

Next came the cases of householder and the town, landlord and the town, and, finally, contractor and the town. The duty of the town under general statutes is to remove garbage effectively. The householder would bring his action against the town for injury to his health through neglect to remove the garbage promptly. The town pleaded a proper contract made with a contractor. The decision was that the duty of the town was absolute; it was responsible to the householder, to whom it must respond, and might afterward pursue its own action against the contractor for any neglect under his contract. If the injury arose through defect in the sewer or other matter under the control of the town, the landlord had his own action against the town, but could not plead the town's neglect as a defense against his tenant.

And so on. The net result at the present time is that the health of the inhabitant is treated as the dominant interest, on the principle, *Salus Populi suprema lex esto.* If injured, the person with whom he immediately deals must respond. If this person's loss be due not to his own neglect or misdoing, but to that of the town, the town in turn must respond to him. The only recourse left to the town is against a contractor, provided one of these and not its own officers be to blame. From this it will be seen what a very long road statutory construction has yet to travel in this country before anything like these principles can be established.

HIGGINS & GRIFFIN have bought out the plumbing shop of C. B. Allen & Co., Salem, Mass., and will continue business at the old stand.

Toronto Master Plumbers.

The Toronto Master Plumbers' Association held their annual meeting in Forum Hall on Monday, March 25, and elected the following officers:

Thos. Cook, president.
W. I. Burroughes, first vice-president.
Geo. Guest, second vice-president.
I. K. Allison, secretary.
A. Fiddes, treasurer.
W. I. Garrant, sergeant-at-arms.

The new officers of the association have a large amount of work before them in getting out a new retail price-list and new by-laws for the association, &c. A special committee was appointed to wait on the city to obtain amendments to the city plumbing ordinance to reduce the license fee, and to restrict the granting of licenses to qualified plumbers only, also that all drains shall be of cast iron and under the control of the plumber, and that in future no license shall he granted unless the applicant has passed a practical examination. It is also proposed that steps will he taken to form a Dominion or National association. The Toronto association is now in a flourishing condition. Twenty-five new members were enrolled. Trade in the city is fairly good and the prospects for a good summer are favorable.

The Report of the Essay Committee.

Under date of March 30 the following report will be sent to local associations of master plumbers by the Essay Committee of the National Association of Master Plumbers, composed of Jeremiah Sheehan, chairman, Thomas Cantwell, Frederick Abel, John F. Reardon and F. R. O'Neil:

The Essay Committee, appointed to report a series of topics to be submitted to the master plumhers for treatment at the next annual convention, beg leave to submit the following list of subjects, which it regards as timely and which relate directly to the main purpose of our association. In order that the committee may have time to review the essays, which it is necessary to do before presenting to the convention, all essays must he in the hands of the chairman of the committee on or before May 15.

Is the association of supply houses beneficial to the master plumbers of the country? If not, how can it be made beneficial? This subject is suggested because the most important event of the year, having a direct relation to the interests of the plumbing trade, has been the action of all the leading supply houses and manufacturers of the country, entered into for the purpose of united action on questions of policy in dealing with master plumbers and others who are in the relation of retailers. Possibly there may be suggestions as to some means by which, through the intermediation of the National Association of Master Plumbers, this new organization may be made of avail as an agency of good, whereby some of the evils which have impaired the prosperity of the plumbing business throughout the country may be eradicated.

To what extent may municipal legislation he relied upon to enhance the standing of the master plumber? Is it not in some cases a bolster and an indorsement to the unworthy? The utterances of many master plumbers during the past two years have made it a mooted question whether, in view of the laxity, favoritism and even corruption which characterize political government, plumhing ordinances can be relied upon to accomplish the purposes which they are designed to serve. To invite full and candid discussion, the above topic is framed in a form seeming to favor the negative.

Would not the interest of the master plumber he served by an agreement that master plumbers should not handle tools? This question is suggested by the fact that many master plumhers are heard to complain that local associations, although intended to benefit all their members, work really to the disadvantage of some. The complainants, as a rule, are men who carry on plumhing as a business, rather than as a trade, and who hold that while membership in the association is accepted by the community as a guarantee that a plumber is competent and reliable as a contractor, his competitor who invests his money in advertising the trade and raising its standard is placed at a disadvantage when it comes to making estimates. In other words, the proposition is advanced that all members of a local association should be strictly master plumbers; while if they continue to handle tools they compete as master plumbers, but do the work as journeymen.

What should he the qualifications of a member of a master plumbers' organization? In other words, is it sufficient that a candidate shall bc competent to wipe a joint? This subject is intended to elicit suggestions as to the improvement of the standard of membership in master plumbers' associations. The first purpose declared by all such associations is that of elevating and improving the plumhing business so that not only the plumber hut the public will he benefited. It is urged by those who are not satisfied with progress thus far made that it is too easy a matter to become a master plumber, and that the standard in place of heing bettered is lowered by the indiscriminate admission of candidates for membership. For instance, should a candidate be able to estimate the value of work and material hefore calling himself a master plumber? Should he be able to pay his bills? Or is it enough that he shall be able to pay an initiation?

What are the abuses that have been developed in the master plumbers' organization? What is the remedy? This question is suggested by the indications that the trade has not attained the prosperity which so many of us confidently expected would result from organization. If this failure he due to the faults of organization or to the practices that have grown up under it, it will be timely information to detail just what these faults and practices are.

Should not the master plumber decline to bid as a sub contractor? Should he not insist that the plumhing he reserved from the general contract? The above question is suggested hy the fact that the contracting business has become so general that even the most incompetent carpenters are now recognized as general bidders, and the architects in their desire to avoid a division of responsibility are disposed to require the plumhers to submit their hids to these men. In many cases these general contractors are utterly irresponsible in a financial way, and the trade has suffered greatly through their failures. It should require no argument to demonstrate that a man who is competent to design and construct a good, handsome and sanitary plumbing system in a residence is too good a man to be subordinated to such incapables as are many that are now bidding on even high grade work.

TRAPS AND VENTS.

All the clay sewer pipe manufacturers of Ohio, Virginia, New York and Pennsylvania, except one, have formed a combination under the terms of which all sales are to be made from Akron, Ohio, and Pittsburgh, Pa.

Considerable information about the sewerage in foreign cities is to he found in No. 173 of Vol. 47 of the Consular Reports to the United States Government.

The Goulds Mfg. Company have just hegun the erection of a new addition to their extensive works at Seneca Falls, N. Y. The building is to he of the slow burning type, will be 86 x 35 feet in size, the frame work, beams, columns and roof truss of steel, and two stories in hight, with basement for the storage of castings. The main room for heavy machines and erecting purposes will be 22 feet high and will be served hy an electric bridge crane of 10 tons capacity. The walls will he of brick with the skylight and upper windows glazed with ribbed glass. It is expected that the building will be completed about June 1.

John Birmingham, South avenue, Bridgeport, Conn., who has heen making a specialty of jobbing plumbing work, intends to go into contract work as soon as the building season opens.

Woodruff & White succeed O. I. Jones in the tinning and plumbing business in Westport, Conn.

The Hercules Float Works is the name of a new corporation organized in Springfield, Mass., for the manufacture of the Hercules seamless copper ball floats for steam traps, receivers, &c. The officers of the new company are: President and treasurer, Harry S. Anderson; clerk, R. H. Parkhurst; directors, H. S. Anderson, H. H. Parkhurst, Frank Engelhard and Fred H. Engelhard. Manufacturing room has been secured at 54 Taylor street. The hollow copper ware of which the company make a speciality is produced by a new patented process without seams and of a quality superior, it is claimed, to hard rolled metal, being perfectly even and homogeneous throughout, without flaws and wholly impervious to water.

J. J. Cashen, who was for a long time with Wm. B. Cashen on State Street, Meriden, Conn., has established a business for himself at 65 Church street, where he has a commodious store and a good stock of plumbing and heating goods.

The Mechanics' Supply Company, Quebec, Canada, are inserting in the business directories published in Montreal, Toronto, Quebec and Halifax a colored advertising page in which they direct attention to their extensive line of goods. Among the particular articles noted are steel clad baths, Jenkins valves and packings, L. S. Starrett Company's fine machinists' tools, steam pipe packing, &c.

An obstinate blaze was extinguished by the Fire Department last Saturday night, located in the basement of James Duffy's plumbing shop, at 124 Main street, Hartford, Conn. The loss was covered by insurance.

R. M. Wilson of Rome, N. Y., reports from the New York office, 92 Walker street, New York, that a nice trade is being done in nickel plated and copper boilers. It is stated that planished copper boilers, although heavily lac-

quered, do not hold their color satisfactorily in use, and that a growing demand is being felt for a nickel plated boiler, as the nickel plate can be kept polished bright without destroying it.

When two plumbers entered into a copartnership agreement to carry on the plumbing business in Kingsbridge, N. Y., they inserted in the articles a clause to the effect that if either of the partners at any time took to the use of intoxicating liquors to the extent that it might interfere with the conduct of the business, the sober partner might have the right to ask for the dissolution of the firm. Acting on this clause, one of the partners made an application in the Superior Court asking that the firm be dissolved and a receiver be appointed. He says that the junior partner has not respected the agreement. The other partner contested the motion, stating that he had affidavits to the effect that he had never so far forgotten the clause as to put the business of the firm in jeopardy. Decision was reserved.

Allen Weinhardt will go into the plumbing business with John Freitag in the place formerly occupied by Dickhout on Wabash avenue, Terre Haute, Ind.

S. A. Worthing has purchased the interest of Mr. Osler in the plumbing business of Brock & Osler, Redlands, Cal.

A deputation of employing plumbers, Toronto, Canada, consisting of Messrs. Allison, Burroughes, Beavis, Cook, Fiddes and Guest, had an interview with the City Engineer recently. They asked that the license fee now paid by plumbers be abolished, and that the clauses in the city plumbing by-law providing for the examination of plumbers, with a view to testing their efficiency, should be enforced before applicants are allowed to undertake work as an employer.

The application of Blake & Murphy, Galesburg, Ill., for a plumber's license, with J. E. Maley and D. Morley as sureties, was granted by the City Council.

An ordinance regulating the licensing of plumbers in the city of Bradford, Pa., has been passed.

A. R. Jordan is making improvements in his plumbing shop on West Broad street, Westerly, R. I.

Curtis Bros. will open a new plumbing, heating and gas fitting establishment at 597 Main street, Dubuque, Iowa.

The firm of Daggett & Schwie Company, Mason City, Iowa, have been dissolved. Messrs. Daggett and Schwie will continue the plumbing and heating business and C. Currie & Son will run the hardware store.

Fred. Doyle and Joseph Caspar compose a new plumbing firm at Houghton, Mich. They are building a new shop on Shelden street, which will be 16 x 40 with plate glass front.

The firm of Smith & Jefts, plumbers and tinsmiths, at the Highlands, Mass., has been dissolved by mutual consent. Mr. Smith having purchased the interest of his partner will carry on the business at the old stand.

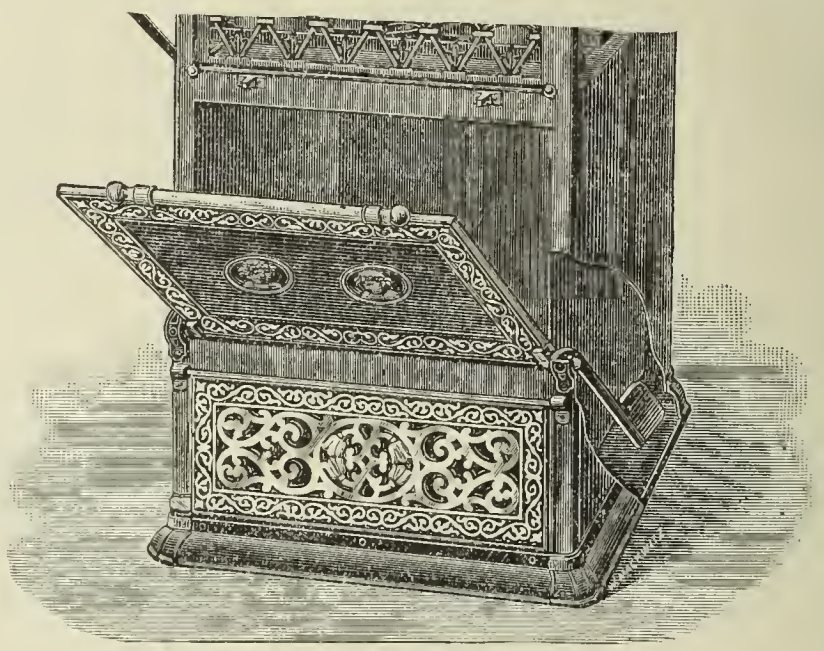
Albert C. Weiant, New Britain, Conn., visited *The Metal Worker* office this week and showed a new pipe support for which he is taking out a patent. The support can be attached quickly, and holds the pipe far enough away from the wood work to permit the use of a pipe wrench and prevent unions, cocks and fittings throwing the pipes out of a straight line.

The Glauber Brass Mfg. Company, Cleveland, Ohio, are issuing a colored picture bearing at the top an inscription stating that "Glauber's famous stop and waste cocks are the world's best and leaders over all others" At the bottom, several styles of their cocks are shown in natural color.

The S. H. Morgan & Co. plumbing and gas fitting firm have filed articles of association with the county clerk at Detroit, Mich.

John F. Deedy opened his new store in Rogers Block, at Salem square, Worcester, Mass., last Saturday, and in the evening he had a formal opening. Visitors found one of the most thoroughly equipped stores of the kind, the stock including everything in the plumbing line from the materials used in cheap houses to the costliest fixtures used in the palatial residences of millionaires. The display also contained Mr. Deedy's own inventions. The north half of the store is fitted up to show the practical working of the newest closets, lavatories, &c. It shows the latest designs in bathtubs, and the lavatories are elaborate affairs, being made of different kinds of marble. The closets are all in working order and show the different kinds of hoppers, some of them being tastefully decorated. The tanks are in keeping with the rest of the materials and are of oak, Hungarian ash, dark cherry, bird's eye maple, natural cherry, antique oak, white enamel and ash, with seats to match. In the rear are located the storerooms and the workrooms, where Mr. Deedy makes all his own traps. In the cellar are the other workrooms. The suit of rooms also includes a general salesroom and a private office.

Curtis Bros. have leased the storeroom at 597 Main street, Dubuque, Iowa, and will open a first-class plumbing, heating and gas fitting establishment.



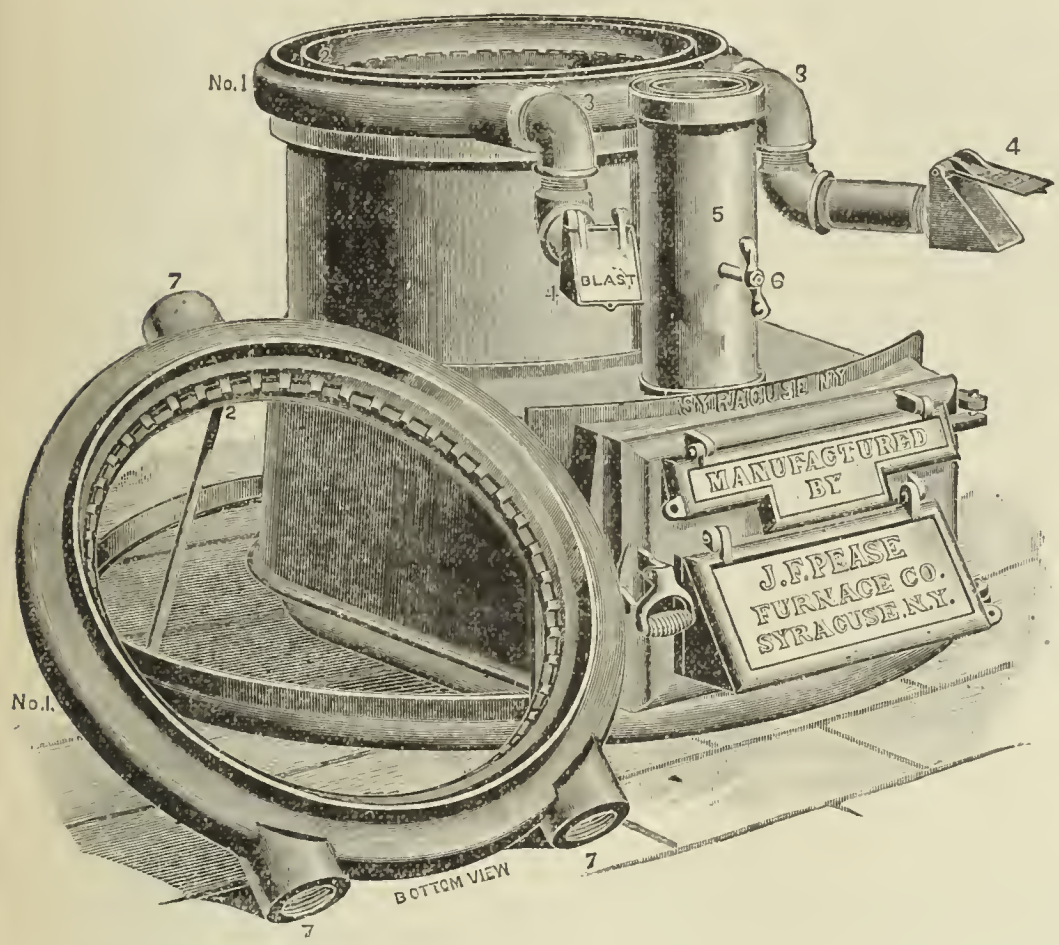
E. W. Blatchford & Co., Chicago, have just issued a small but excellent catalogue of their lead traps and bends. The variety illustrated is very large, covering all possible requirements of the trade. The Blatchford drawn and compressed lead traps and bends are made in the same manner as lead pipe, rendered stiff by a special process, while at the same time they can be drawn to any extent required. Full price-lists are also given.

John A. Mangold, graduate of the New York Trade School plumbing class of '93, intends to open up a plumbing shop at Moundsville, W. Va. As water works are being put in the town a good deal of plumbing work is in sight.

The following delegates were elected at the meeting held by the Chicago Master Plumbers' Association on the 25th inst., to attend the Illinois State convention to be held at Rock Island April 24: J. B. Breen, J. R. Alcock, P. Sanders, D. J. Rock, C. J. Herbert, M. L. Mandible, Charles T. Byrne, Paul Redieske, Thomas Conway and J. L. Emblen.

Among the new plumbing establishments recently started in Chicago can be mentioned the following: Daniel Galvin, 3246 South Canal street; Henderson & Thoile, 22 North Ashland avenue; Thomas Forbes, 795 West Van Buren street; Clayton & Miller, 475 West North avenue.

Walters, Reilly & Wafer is the name of a new firm of plumbers reorganized in Fort Dodge, Iowa. They will have their headquarters in the new addition to the Doud Block.



The Quick Meal Vapor Stove, Showing the Balanced Oven Door.

The Quick Meal Balanced Door.

An interesting feature of the Quick Meal vapor stove, which is being offered the trade this season by the Ringen Stove Company of St. Louis, Mo., is the balanced oven door. The arrangement is such that a weight working inside of the flue and connected directly to the hinge of the oven door allows the latter to fall to a horizontal position, where it forms a convenient shelf. An idea of the arrangement of parts may be gained from an inspection of the accompanying illustration, which represents the stove with a portion of the side broken away so as to indicate the position of the weight referred to. This weight is of such a character as to balance the door and allows it to fall without noise and also without danger of breakage. When the oven is in use the weight swings toward the front, where it assumes a horizontal position and offers no obstruction to the flue.

Air Blast Apparatus.

The J. F. Pease Furnace Company, Syracuse, N. Y., have devised an apparatus for the efficient and clean burning of bituminous coal in hot air furnaces, which is illustrated in the accompanying cuts, Figs. 1 and 2. It is well known that the burning of soft coal for domestic purposes has always been attended with difficulty arising from the formation of soot, which adhered to the heating surface, clogged the flues and reduced the radiating powers of its surface, and sometimes even going so far as to fill up the smoke exit and materially interfere with the draft. To secure complete combustion of bituminous coal the system devised by the J. F. Pease Furnace Company provides for the introduction of hot air around the surface of the fire. The air being about one-quarter oxygen stimulates combustion and consumes the otherwise unburned gases. In the device illustrated in Fig. 1 the air is drawn into the ring through three supply pipes, two in the front and one in the rear. Each of the air chutes is provided with a regulating door, so that the supply of air can be adjusted to suit the draft and other varying conditions. The air is heated to a high temperature in passing through the supply pipe and through the heated ring and is distributed over the face of the fire through horizontal slots shown in the illustration. It is mentioned that the outlet area of all of the slots is less than that of the intaking pipes, so that the air is discharged in full volume from each slot. Fig. 2 is a transverse section through the ring showing the form of the interior and the course taken by the air. The slots, it will be noticed, are protected by a canopy which prevents fine particles of fuel lodging in the openings when the fire is replenished. This feature is particularly alluded to and it is mentioned that it is covered by patents. The ring is said to be easily set, fitting into a cup joint on the top of the fire pot, and is provided with a cup joint on its top, on which the combustion chamber rests. The pipe connections and fittings can easily be put together with an ordinary wrench. These rings are provided for the Pease furnaces Nos. 308 to 320, inclusive, of the Regular Low Down Double Radiator and Tropic patterns, as well as in all sizes of the 1895 pattern. It is furthermore mentioned that they can be introduced into old furnaces of these patterns with little expense and work.

Air Blast Apparatus.—Fig. 1.—Soft Coal Burning Apparatus, Fire Pot and Ring

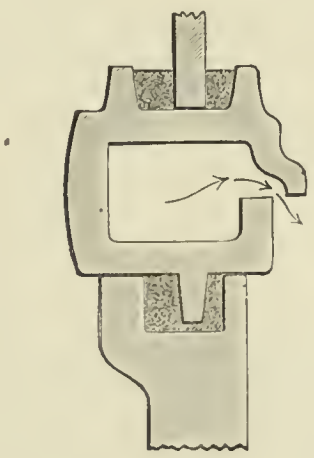


Fig. 2.—Transverse Section through Air Blast Ring.

Among the improvements brought out by the J. F. Pease Furnace Company is an air blast for hard coal also. They mention that while the combustion of bituminous coal is very much improved by the intermixing of hot air—that is, oxygen—it is also pointed out that the burning of hard coal is likewise improved by the use of similar appliances. In Figs. 3 and 4 is illustrated an air blast designed for use in hard coal burning furnaces. It is said to be particularly well adapted to the 1895 pattern furnace of the J. F. Pease Furnace Company, the dome of which is somewhat higher above the outlet than in any other furnace. It is further mentioned that the use of this small sectional air blast ring aids in the combustion of soft coal, although for most kinds of this

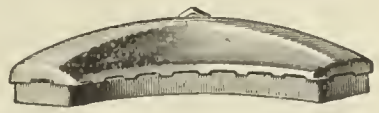

Fig. 3—Sectional Air Blast for Hard Coal Furnaces, Correct View.

fuel a larger ring is recommended. Fig. 3 shows the correct position of the distributor, while Fig. 4 shows it with the lower sides presented to view. It is fitted to the inside of the combustion chamber immediately over the top of the pot and directly opposite the feed door. The one air supply pipe runs down the

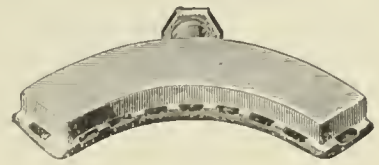

Fig. 4.—Reverse View of Section.

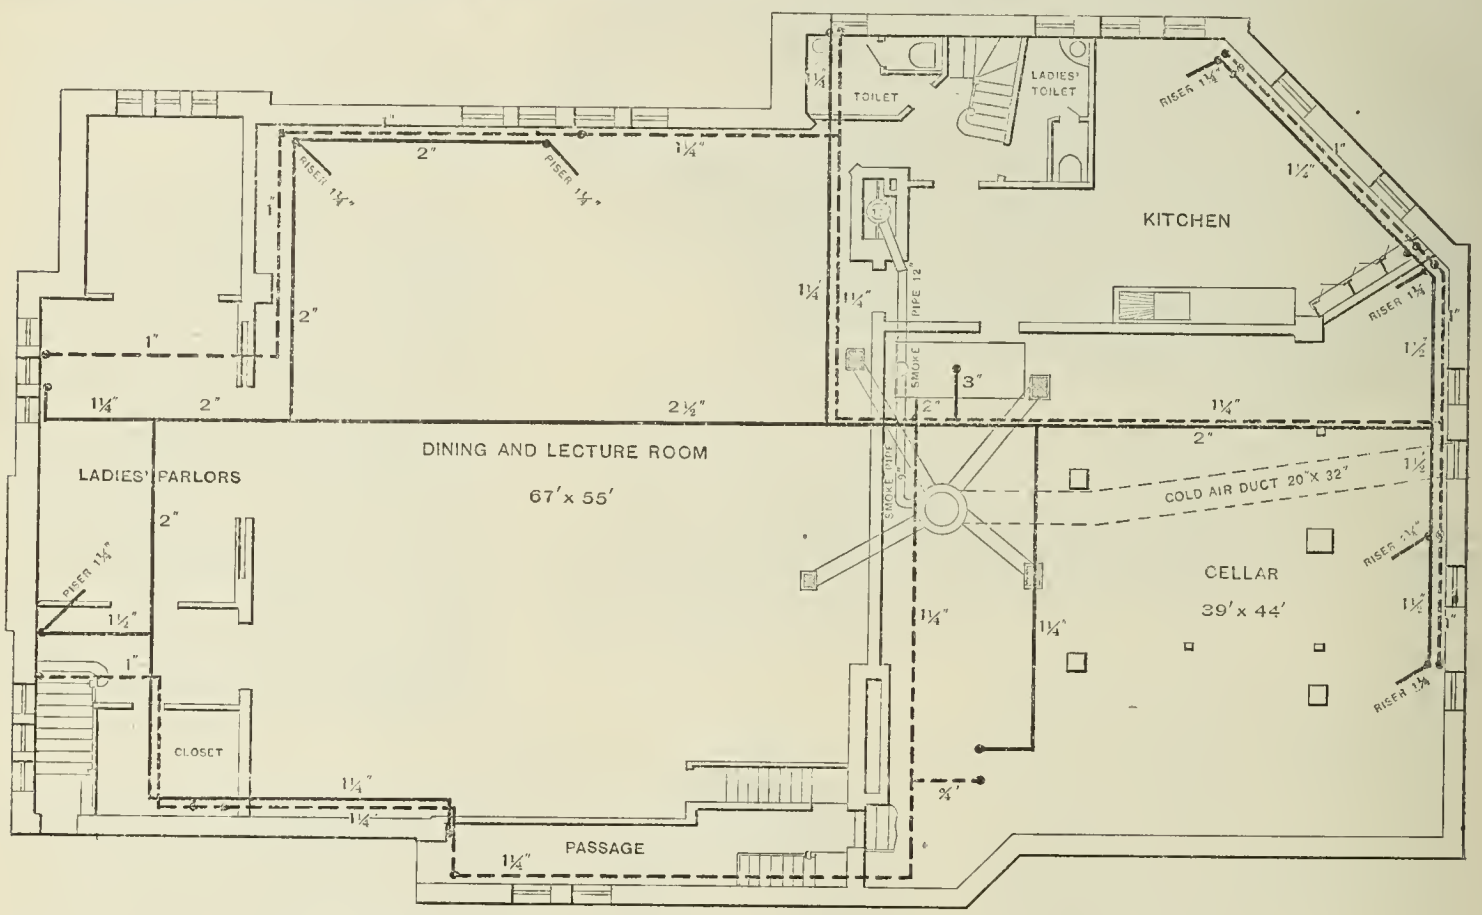
back of the fire pot and terminates outside the casing in an air chute with a regulating door.

The Morton Tin Plate Company, Cambridge, Ohio, whose advertisement appears upon another page, announce that they are prepared to commence the manufacture of Tin and Terne Plates. The brands will be Morton Charcoal, Guernsey Coke and Leatherwood Terne, all made by the Morewood process. The company have been manufacturing Black Plates since the beginning of the year, and their product has found favor among dippers. They state that the same care that has been exercised in the manufacture of Black Plates will be carried out in the case of the Finished Plates, only high grade qualities being produced. No selling agents have been appointed by the company, their intention being to dispose of their product direct from headquarters at Cambridge, Ohio.

It is reported that the syndicate of New York and Philadelphia capitalists who are building the electric roads in and about Baltimore and Washington, have organized a company with a capital of $4,000,000, to construct an electric railroad between New York and Atlantic City, N. J.

The use of terra cotta is becoming so widespread that the question of how to treat the surface of this material so as render it less liable to injury and decay, without impairing its appearance, is one of considerable interest. European journals announce that an effective method of treating terra cotta has been recently introduced by E. Fortora of Naples, Italy, a place where this material is largely used for decorative purposes. Mr. Fortora recommends that the terra cotta be immersed in a bath of paraffine wax at a temperature above the boiling point of water, but below that of wax. All moisture and air are said to be expelled by this treatment from the pores of the material, and an absorption of the molten wax takes place. It is claimed that all porous material of the character of terra cotta is vastly improved when subjected to this treatment, and is, moreover, rendered quite impervious to water.



STEAM AND HOT WATER.

An Unusual Combination System.

The system of heating and ventilation used at the Andrews M. E. Church, on the corner of Richmond and Fulton streets, Brooklyn, N. Y., the plans of which were prepared by architects Kramer & Simonson, Metropolitan Building, New York, is, from its unusual character, one of more than ordinary interest. The plant was installed by S. G. Richards of 1454 Broadway, Brooklyn, N. Y., and designed by W. E. Roys, heating engineer. The heating system provides for an influx of warm fresh air, also a more direct and positive system of heating, and a method of exhausting the air from the church to secure ventilation. The fresh air is supplied by a No. 57 Pride of Brooklyn hot air furnace located as shown in Fig. 1, which is a plan of the lecture room and cellar of the church. It was installed in the cellar and supplied with air from out of doors by means of an air duct having inside dimensions 20 x 32 inches. The air when heated is conducted to the lecture room of the church and to the Sunday school room by means of 14 inch tin pipes leading to registers in the floor, there being two registers in the church and in the Sunday school room, as shown in Fig. 1. A plan of the church and Sunday school room is shown in Fig. 2. Fig. 3 shows the gallery of the church and the arrangement of the class rooms and Epworth League room above the primary room. The two pipes which lead to registers in the floor of the church are arranged by means of dampers of a special construction so that the air may be discharged into the lecture room when desired, the lecture room being on the same floor as the furnace and the pipes to the church running through it. Beside the hot air furnace is placed a No. 5 Pride of Brooklyn steam heater of pipe construction, from which the steam mains run to direct radiators located in different parts of the church. The smoke pipe from both the steam boiler and the hot air furnace connect with an 18 inch pipe made of No. 16 iron, inclosed in the ventilating shaft, which is 30 x 56 inches in size and divided into two flues, each 15 x 56, by means of a partition. In the sides of these ventilating shafts, both in the church and in the Sunday school room, large registers are placed near the floor, and a current of air is drawn from the church through them by means of the heat imparted to the shaft by the sheet iron smoke stack. A Jackson grate in the Epworth League room affords means of heating it when there is no other fire in the church, and also aids in ventilation.

From the top of the steam boiler a 3-inch main is taken, merging into two branches, a 2-inch main running under the Sunday school room, a 1¼ inch branch being taken to a radiator of 33 feet of surface in the vestibule. Then the main continues 2 inches in size until it reaches a point under the class rooms, where it separates into two 1¼-inch branches, one branch running to the primary school on the first floor, where a 1¼ inch connection is made with a radiator of 55 feet of surface and a 1¼-inch riser is taken from the end of the main to a radiator having 44 feet of surface in the Epworth League room immediately above. One-inch branches are also taken from this branch main to two class rooms on both the first and second floors, having respectively 22 and 17 feet of surface in the radiators. The other 1¼-inch branch main continues this size until connections are taken for two class rooms on both the first and second floors, having respectively 22 and 17 feet of surface in the radiators in them. Then the main ends in a 1¼-inch riser feeding four radiators, two in large class rooms on the first and second floors, having respectively 33 and 28 feet of surface, and two in smaller rooms having respectively 22 and 17 feet of surface. Immediately beneath the steam main the return pipe for the condensation from each end is run 1 inch in size, receiving the condensation from all the radiators mentioned and merging into a 1¼ inch return running over toward the boiler.

The other branch from the 3-inch main from the boiler is a 2½-inch main which extends toward the front of the church, a 2-inch branch being taken to one side of the church where a 1¼ inch riser is taken from a coil having 90 feet of surface in the gallery. From this point the main continues full size to another radiator having 133 feet of surface, near a large window in the auditorium. The principal main continues beyond this branch 2 inches in size, a 1¼-inch radiator connection being taken to a radiator having 48 feet of surface at one

An Unusual Combination System.—Fig. 1.—Showing Heating Apparatus and Piping.

side of the vestibule. The main makes a right angle turn at this branch toward the side of the church and continues 2 inches in size until a connection is taken from each of the mains just after they leave the boiler and run to radiators of 32 feet in the vestibules at each side of the Sunday school room. There are two afforded by large ventilators in the ceilings of both of the larger rooms, and to carry off the heated air when the audience has assembled and the lights

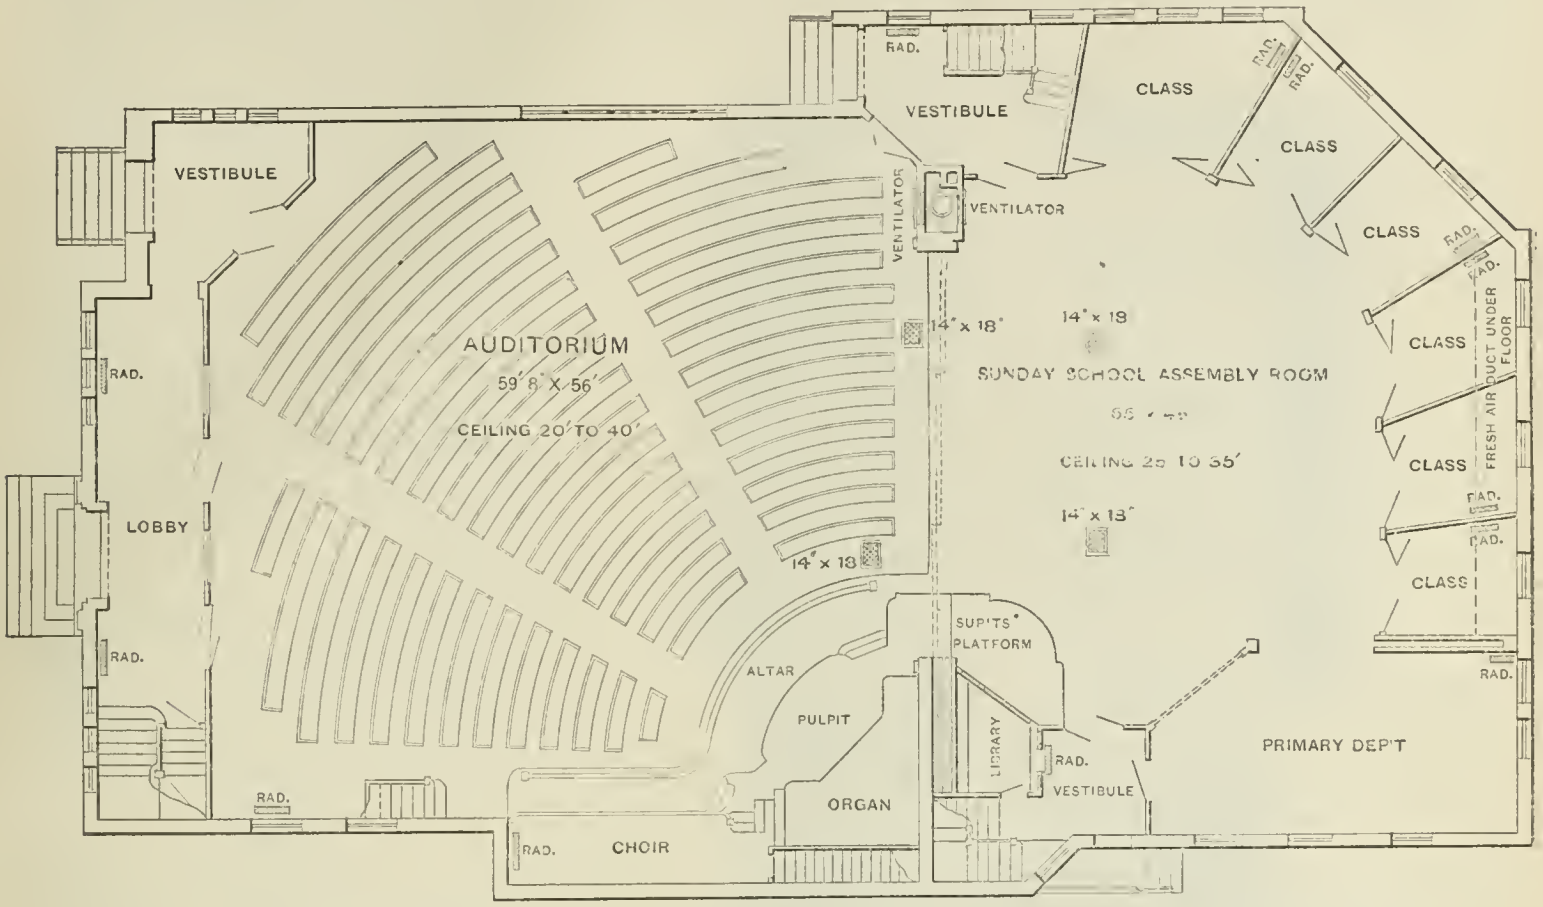


Fig. 2.—Plan of Main Floor.

to a radiator having 24 feet of surface at the other side of the vestibule. After this connection the main is reduced to 1¼ inches, running toward the side of the church, where it makes another turn, and a 1¼-inch riser is taken to a radiator having 113 feet of surface. It then continues 1¼ inches in size to a radiator having 80 feet of surface near the choir. Separate 1¼-inch branches are taken returns for condensation, each beginning at one of the radiators in the vestibules and running around the side of the church, increasing in size and connecting with all the radiators until two 1¼-inch branches meet the 1¼-inch return from the Sunday school room, where they merge into a 2-inch return which is connected with the boiler.

An additional means of ventilation is are used in the evening. In operation the plant has given excellent satisfaction, the fresh air furnished by the hot air furnace providing an agreeable atmosphere and the radiators carried by the steam boiler affording a heat that is more than is necessary for the early fall and late spring. The ventilating shaft has been very effective in carrying off the colder air in the lower portion of the

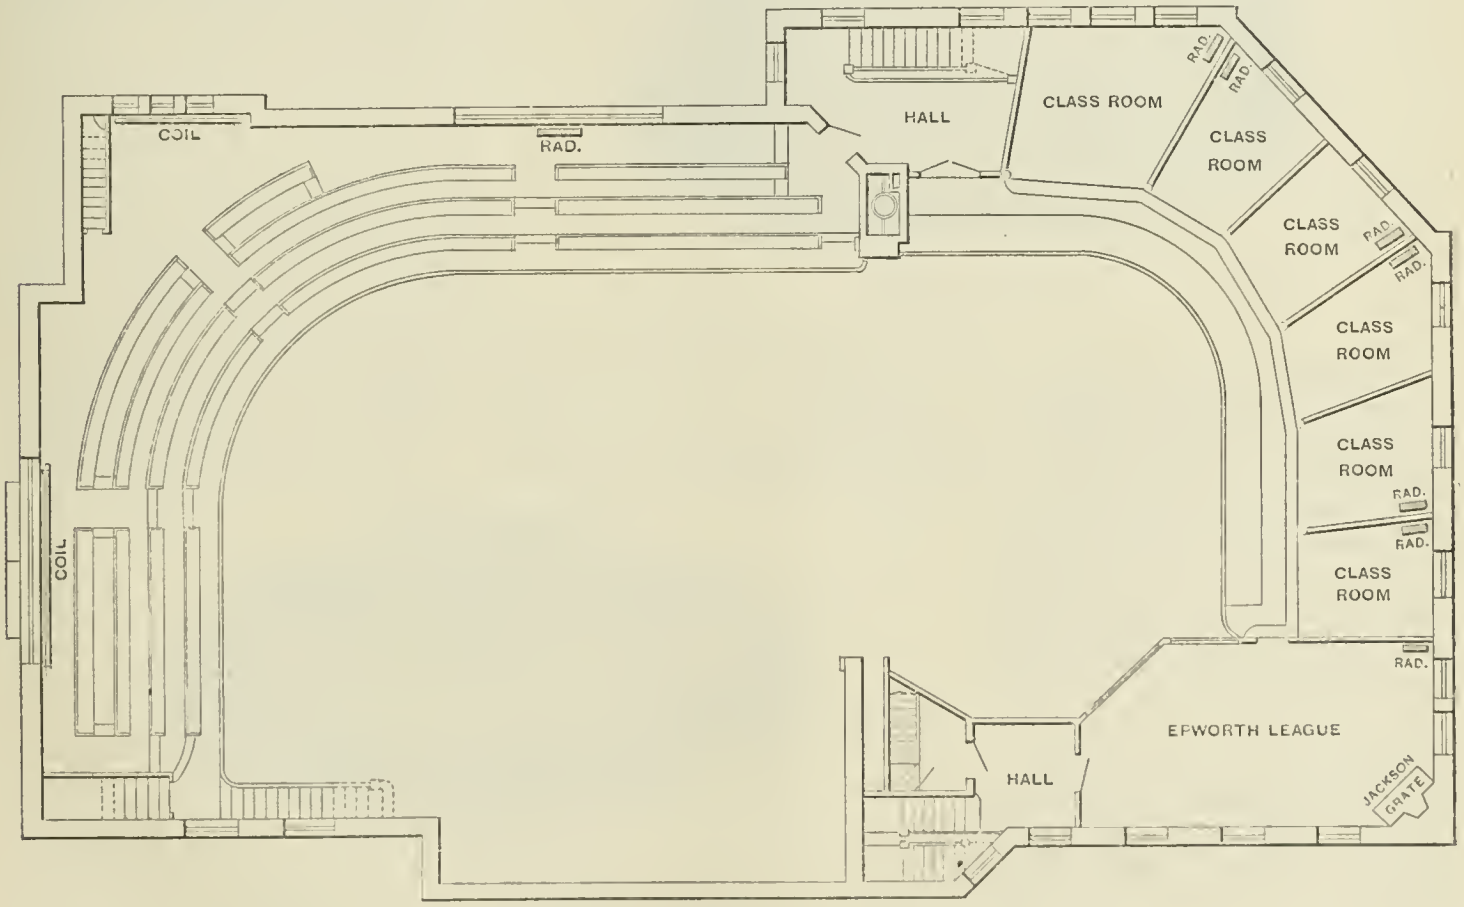

Fig. 3.—Plan of Gallery.

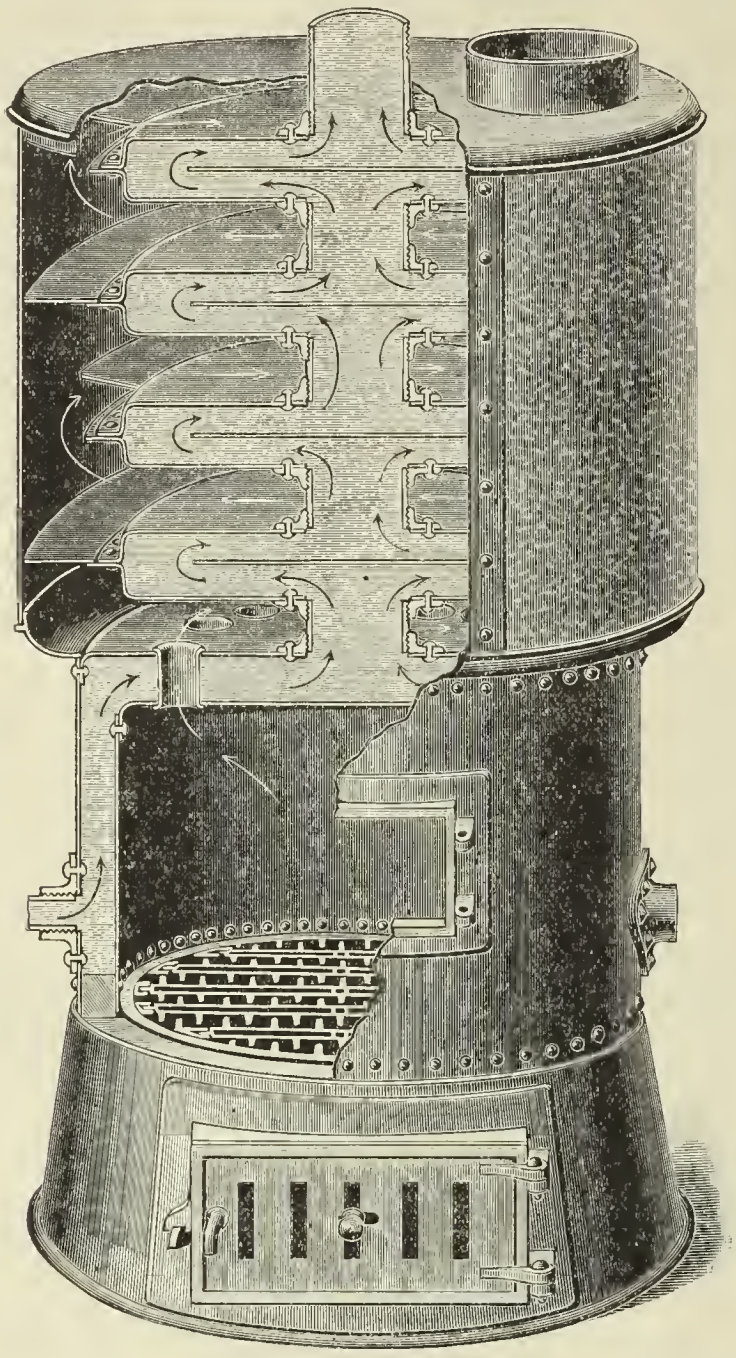

church, making it easy for warm air to flow in when the church is being heated by the furnace. A feature of the plant which has been found specially pleasing is its ability to heat the church without overheating by means of the hot air furnace when the weather is mild, and the steam radiators have been found sufficient for the coldest weather.

For those who desire to make further calculations on this heating plant it may be stated that the ceiling of the church proper is 40 feet high in the center and 20 feet on the side walls, while the ceiling of the Sunday school room is 35 feet high in the center and 25 feet high on the side walls, and that the class rooms, lobby and Epworth League rooms extend only two stories in hight, the ceiling of each floor being about 9 feet. In addition to the arrangement of the hot air furnace for heating the lecture room, the steam pipes which run through it are used as a heating surface, not being covered. The ceiling of this room is about 9 feet high.

W. H. HARRIS of the Standard Radiator Company of Buffalo, N. Y., visited Manager John Leitch and his assistant, Frank C. Perew, at the New York office, 206 Centre street, this week. Mr. Harris was returning from a short sojourn in Florida.

The Lily Steel Hot Water Heater.

Rubel & Co., 77 Lake street, Chicago, have just brought out a new hot water heater, named the Lily, on which they have applied for a patent. It is herewith illustrated. It is of the vertical type, with horizontal sections, circular in form. The sections are easily connected or disconnected, so that their number may be increased or diminished as desired. The connection is formed by a nipple, which firmly unites the sections and allows the free passage of the heated water.

The Lily Steel Hot Water Heater.—Fig. 1.—Broken View.

The broken view of the heater, Fig. 1, enables the distribution of heat and the circulation of the water to be easily explained. The fire chamber section has a number of circular holes in the top, through which the heat of the fire and products of combustion pass, being directed around the several sections by baffle plates until they reach the chimney connection at the top. The baffle plates, as shown in Fig. 2, are so arranged that they can be turned to any position, enabling the pipe collar to be shifted to any part of the top of the heater. The water circulation is arranged very efficiently. The return pipes discharge cold water into a water jacket around the fire chamber. As the water is heated it passes upward into the first section. Here a square diaphragm is encountered which causes the water to pass to the sides, becoming more highly heated on its passage and finally ascending to the next section, where the same thing occurs, and so on uutil the flow pipes are reached at the top. A large door in the top casing enables the smoke flues to be easily cleaned.

The manufacturers believe this to be the first sectional hot water heater made entirely of steel. No cast iron parts are used in the heater itself, but only in the grate, door frames, &c. Eleven sizes will be furnished, ranging from the smallest, with a capacity for 600 square feet of radiation, to the largest size, rated at 3000 square feet.

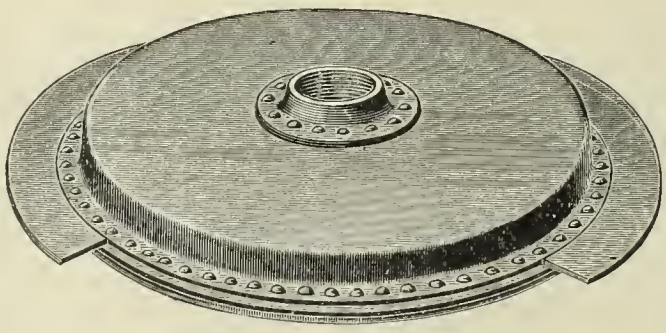

Fig. 2.—One of the Sections with Baffle Plate.

Ventilation.

From SAMUEL HEINS, *Roundout, N. Y.*—On the subject of ventilation, which is a very important one, I have a few words to say and on the popular errors which should be corrected. There are many readers of *The Metal Worker* who I know are interested in this subject, which I consider one of the most important things of a building, and the people who contemplate building should give their especial attention to the ventilation as well as the plumbing. For the last five years I have made a thorough study of this branch. There are many fairly well educated persons who cannot understand that ventilation does not necessarily mean an open window or a draft of wind, and who would fancy themselves ill provided with pure air even in the best ventilated rooms wherein these objectionable features were not certain evidence to the eye and feeling that some outside air was entering. The two ideas of wind and coolness form the whole of the public knowledge in regard to ventilation. There is also the incidental belief that foul air rises and that there must be some means provided for letting it out. This idea takes concrete form in the little whirligig seen in so many office windows and in the tendency toward opening windows at the top on general principles. The general belief and tradition is to make a hole somewhere in the upper part of the room and then all foul odors, bad air and other improper things

in the atmosphere will quietly and of their own accord and free will let themselves cut. In these crude ideas we have practically all that the public knows or cares about ventilation. In the actual practice of the individual there is no intelligent appreciation of pure air, nor can most people tell whether the air they breathe is fit for respiration. Even people belonging to the educated classes do not use the evidence of their senses in regard to the quality of the air in their houses. It is the duty of sanitary and ventilating engineers to educate the public up to a higher plane as regards ventilation, and in order to do this there must be more general appreciation of the difference between pure air and foul air from their own characteristics rather than from circumstances which have nothing to do with the case. This means, of course, that attention must be given to methods for testing the quality of air in and of itself, without reference to visible means of supplying it or to its available effects upon the surface of the human body. When this educational work has been accomplished the field of the engineer who devotes himself exclusively to ventilation will be the widest of any belonging to the engineering profession.

HEATING NOTES.

S. T. Williams is again on the engineering staff of Geo. B. Cobb & Co., 96 Centre street, New York.

The Armstrong Mfg. Company, 139 Centre street, New York, report that recently they have been quite busy on orders for their hand pipe cutting tools and adjustable dies for threading pipes. They say that there is a steadily increasing demand for their goods all through the country and that many pipe fitters that use solid dies for shop work consider a set of their adjustable dies indispensable for outside jobbing work.

J. A. Goodrich of the American Radiator Company, 92 Centre street, New York, is enjoying a well earned vacation in Bermuda.

The Orient Radiator, made by T. C. Joy & Co., Titusville, Pa., will be used in the Sachs Building, Twenty-fourth street, New York, 10,000 square feet of surface being required.

Dwight Smith, who has been recently engaged in the plumbing and steam heating business in Penn Yan, N. Y., has returned to Canandaigua.

A writer in a Philadelphia paper, in defense of steam, says in answer to the following statement: "The era of steam is passing away." There is no electric power or heat that does not trace back to a steam boiler except where there is water power. The product of steam—electricity—can never exceed its producing power; this is a common sense principle.

A gayly colored picture, cleverly imitating a special water color work by Archie Gunn, is the decorative feature of a calendar issued by the J. H. McLain Company, Canton, Ohio. Instead of sending the calendars at the time of the year which is usual for distribution, they have delayed it until the month of March, and we do not doubt they will reap benefit from distributing them at this time, when so many of the January calendars have been lost. The picture shows a young woman in springtime garb and surrounded by springtime associations, and represents, we are told, "An American Girl Up to Date."

T. C. Joy & Co., Titusville, Pa., are showing at their New York office, 48 Centre street, a sample of their new Zenith radiator, which occupies less space than the ordinary loop radiator and has a large flue surface. They have a new catalogue in course of preparation which will show their different radiators and pictures of some of the prominent buildings in which their radiators have been used.

As an indication of the prominent part the manufacture of steam fittings and heating apparatus is playing in the industries of the country, it may be mentioned that according to the last census these products were valued at over $23,000,000, and there has been a great increase in business since the last census was taken.

The United States Heater Company have completed their new factory at Detroit, Mich. The machinery was started a few days ago and the entire plant is now in full operation. They have a very complete and well equipped establishment and advise us that they are prepared to fill all orders promptly.

The catalogues issued by M. Mahony, Troy, N. Y., relating to the Mahony vertical section boiler for steam or hot water heating are attractive publications of convenient size. The leaves are held together by a silk cord at the back instead of being bound in the usual way, and have covers of tinted paper. General and sectional views are shown of both types of boilers and views of the separate sections of each are likewise presented; also a picture of the grate, as well as smaller illustrations of the other boilers made by Mr. Mahony. The cuts are finely executed and finely printed also, and the accompanying text gives a full description of the boilers, which are the same as were recently illustrated in *The Metal Worker*. The steam boiler has a capacity ranging from 1600 to 2700 square feet and the water boiler from 2700 to 4500 square feet.

Exeter radiators are being used in Mr. Jenkins'—of the firm of Jenkins Brothers, valve manufacturers—elegant new residence on Beacon street, Boston.

Lockwood & Adams, 69 Centre street, New York, have added to their line of radiation the Napoleon radiator made by Moore Brothers & Co. of Elizabeth, N. J.

John A. Scollay, 74–76 Myrtle avenue, Brooklyn, and 89–91 Centre street, New York, is furnishing a Brooklyn street directory and city guide, on the front of which is a cut of his hot water apparatus, and a notice that he makes a specialty of apparatus for heating residences and greenhouses.

The elevators in the public buildings in Philadelphia recently dropped to the cellar at the time of the day when they are most in use. Those who were on them at the time were more or less frightened. The trouble was caused by a section of the 14 inch pipe in connection of the hydraulic lift giving way. The pipe in question had been tested up to 100 pounds and was ¾ inch thick. For several hours during the day of the accident it was run at a pressure of 125 pounds, in order to do the work that was ordinarily done by another system. After carrying this pressure for several hours one section split, flooding the cellar and dropping the elevators. On examining the pipe after the accident it was found that throughout its entire length only a thin film of the metal on the outside had thoroughly fused in the mold. Under the examination the fracture showed that the metal had run together along the entire length of the pipe, but had only fused on the outer side for a very slight thickness, and showed an extended case of "cold shut."

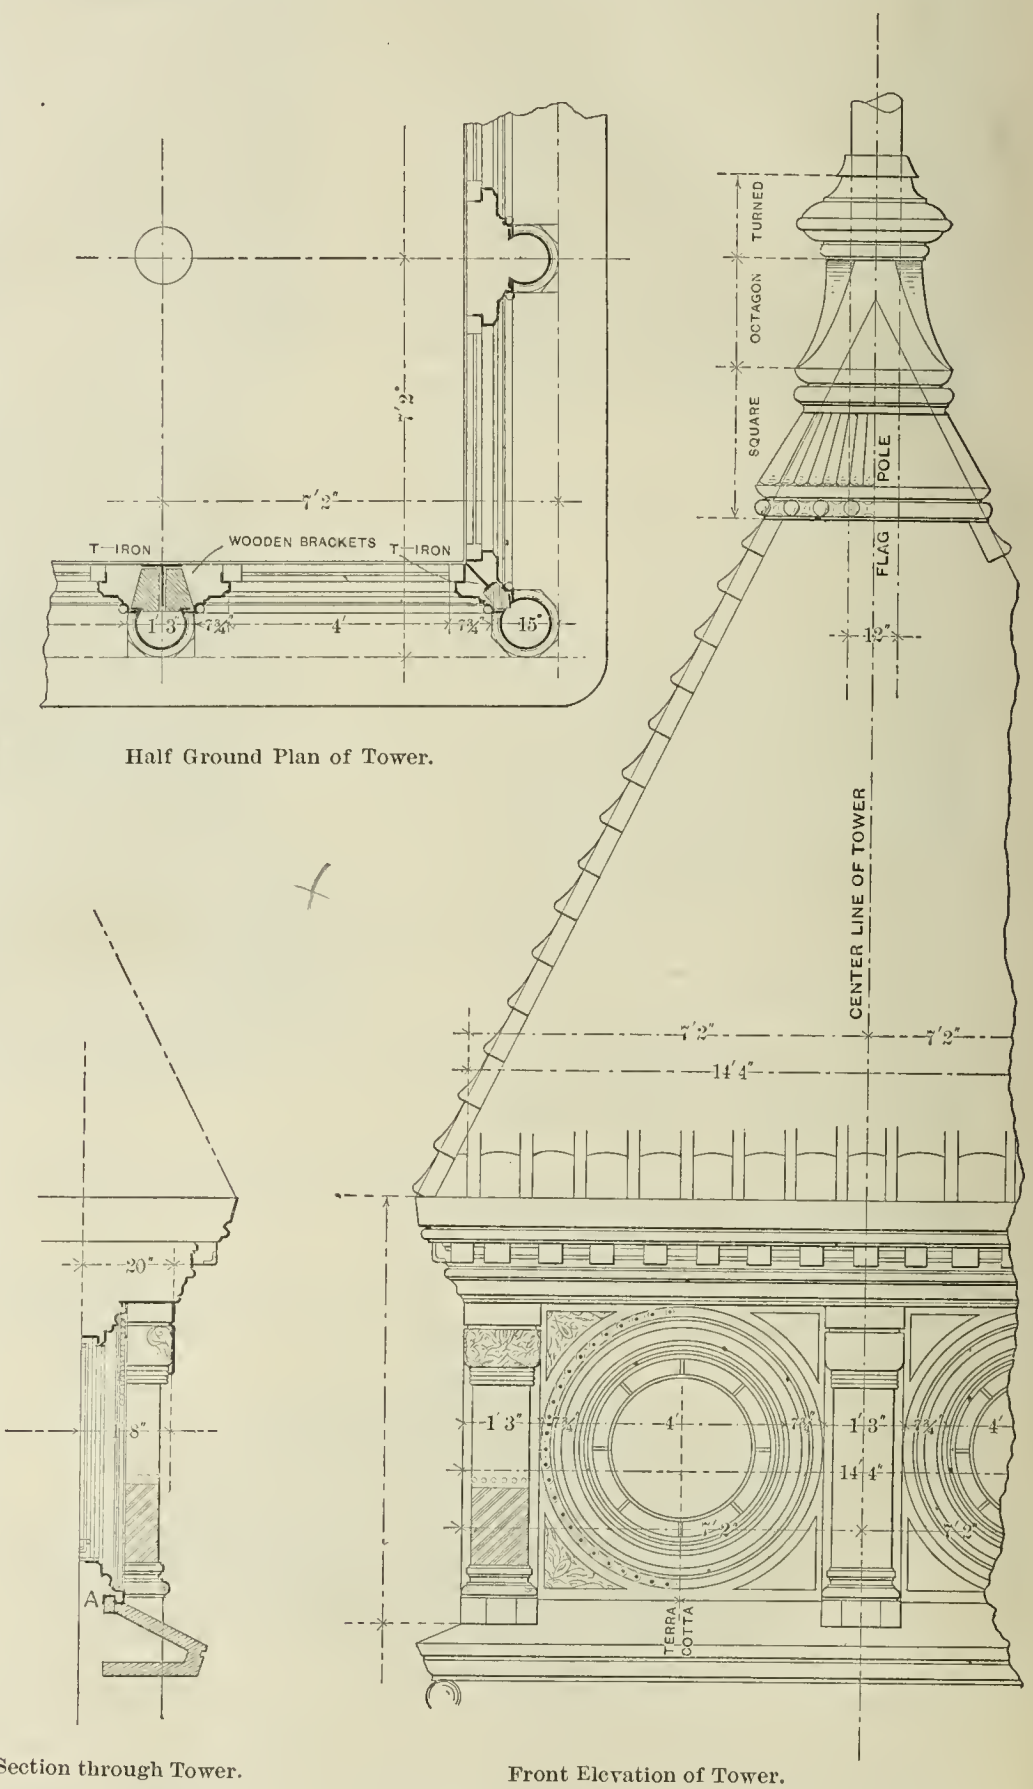
E. W. Stradling, president of the Stradling Plumbing & Heating Company, Utica, N. Y., was one of the visitors at *The Metal Worker* office this week. Mr. Stradling reports that his company have set a large number of the Royal boilers and is much pleased with their work this winter.

The United States Heater Company, Detroit, Mich., send out one of their postal travelers showing on the back a general view of their works. The text on the front of the card tells the hard times they had in filling orders last year, because they were in the hands of their friends. Now they are making their own goods and can ship promptly.

The Kewanee Boiler Company, 96 Lake street, Chicago, are to move to more commodious quarters at 54 Dearborn street, where they have secured the entire first floor, and will have ample space for the display of a full line of Haxtun boilers and Tabasco hot water heaters.

After an interval of comparative quiet the Latin-American portion of this continent has once more relapsed into what seems to be its normal condition of revolution and unrest. Discord between contending factions in Peru has resulted in bloody hostilities at Lima, followed by the establishment of a provisional government consisting of representatives of both parties, a condition of things which cannot long exist. War is threatened between Chili and Argentina, in which Bolivia and Ecuador may be involved. An uprising in opposition to the existing government is reported in Salvador; Venezuela is more or less embroiled with some of the European powers, and the island of Cuba is the scene of a serious revolution, which has paralyzed trade in that country.

United States Consul Germain, at Zurich, is of the opinion that there is an opening for the introduction into Switzerland of American wood working machinery and tools. He writes that if a good agent, speaking French and German, were sent out to visit Swiss manufacturers he would be able to secure large orders. He also thinks that American manufacturers in these lines might find a good market in Germany, England, France, Austria, Hungary and Italy.



Judge Lacombe, in the United States Circuit Court, New York, dissolved last week five injunctions, issued on July 7, 1893, restraining a number of electric light and illuminating companies from infringing a patent for an improvement in electric lights granted to Thomas A. Edison, and controlled by the Edison Electric Light Company and the Edison Electric Illuminating Company of New York. The injunctions were dissolved on the ground that a prior patent, issued to Edison in Canada on November 17, 1879 for 15 years, has expired.

ROOFING AND CORNICE.

Tower Work in Copper.

BY W. N.

The front elevation, section and ground plan printed in Fig. 1 show the copper work of a tower which was recently executed of 16-ounce cold rolled copper. By referring to the front elevation and section, and to Figs. 2 and 3, it will be seen that the foundation of the copper work is terra cotta. Of particular interest are the methods of fastening the copper work at the building, and for this reason the details of construction have been prepared. T C in Fig. 2 represents the terra cotta cornice, which is L-shaped at the top, as shown at S. Over this L-shaped terra cotta the flashing A is formed, as shown in Fig. 2, and prevents the water from getting inside of the building. This flashing A is placed around the entire tower, the corners and cross seams being soldered water tight. It will be noticed that the flashing extends down the inside, as shown at S, and is slightly bent downward, as shown at B. The corners and cross seams being soldered, no other fastenings are required, as the flashing is bent so as to spring tightly over the terra cotta. The columns shown on the front elevation were then set, and fastened at the bottom by soldering to the copper flashing at the bottom, and fastened at the top by screwing to the wooden brackets which are bolted to the T-irons shown on the ground plan, Fig. 1. The cornice shown on front elevation was then set over the columns and secured by means of copper wire and bands to the iron frame work of the tower. The next step was the setting of the circular windows shown on the front elevation, which, as will be noticed, are inclosed in a square panel. Fig. 3 shows the method of fastening these windows, which is as follows: A represents the terra cotta, B the flashing over the terra cotta and L the drip which is formed to the bottom of the windows and soldered to the flashing B at D. The flange C in Fig. 3 extends around the other three sides of the window, and with copper rivets is riveted to the flange of the columns and cornice. All braces are fastened by means of brass bolts and copper rivets. After all this work was completed the roof was covered with Spanish tile, which were nailed to the porous terra cotta blocks. Over these tiles the copper flag pole base was set, as will be noticed by referring to the front elevation. The lower part of the base is square, the middle part a transition from square to octagon, and the upper part round. V, in Fig. 4, shows a sectional view of the flag pole, and also shows the method of obtaining a water tight joint at the top. V represents the circular molding placed around the top, with a space of 1 to 2 inches from the top of the molding A to the side of the pole. This space is allowed so that in stormy weather, when the pole begins to sway, it will not injure the molding or cause leaks. The funnel or collar B is placed over this molding, the collar having a space of 1 to 2 inches around the top of the molding A, and is nailed closely in white lead against the pole. To be perfectly sure of a water tight joint, another collar, shown at C, is placed over the funnel B, leaving a space between the two funnels, and is nailed in white lead to the flag pole. A hook edge is bent at A as shown, so as to catch the snow when blowing under. This method of construction around the flag pole also gives ventilation under the tower roof, as shown by the arrows in Fig. 4. In many cases where the molding A, Fig. 4, was nailed direct to the flag pole, it has been broken when the flag pole began to sway, causing

Tower Work in Copper.—Fig. 1.—Elevation, Plan and Section.

leaks; and it is an expensive matter to stop leaks in such a place, owing to the difficulty of reaching the pole.

Slate for Roofing.

In an interesting article discussing the various forms of roof coverings employed since the early history of the world, G. B. Benfoid presents in a late issue of *Stone* some remarks on slate which are worthy of repetition in this connection. Among other things he says:

The first slate used in this country, undoubtedly, was brought over from Europe, although it was known that slate could be found in this section of the country, yet it was a long while before any person began to make any use of it. The first quarry had been opened for nearly eight years before any roofing slate was manufactured.

The first quarry in the neighborhood was opened by Col. Allanson Allen of Fair Haven, Vt., in 1839, at Scotch Hill. He manufactured school slabs extensively; in 1847 he commenced the making of roofing slate, and in 1848 he abandoned the school slate trade in favor of that of roofing slate.

The first roof covered with Vermont slate was done by Col. Allanson Allen in 1848, and under these conditions: He was to wait one year for his pay, and if in the mean time the roof should break down from the weight of slate he was to receive no pay, but should pay all damages. The farmer was disappointed, and the roof is good to-day. . . .

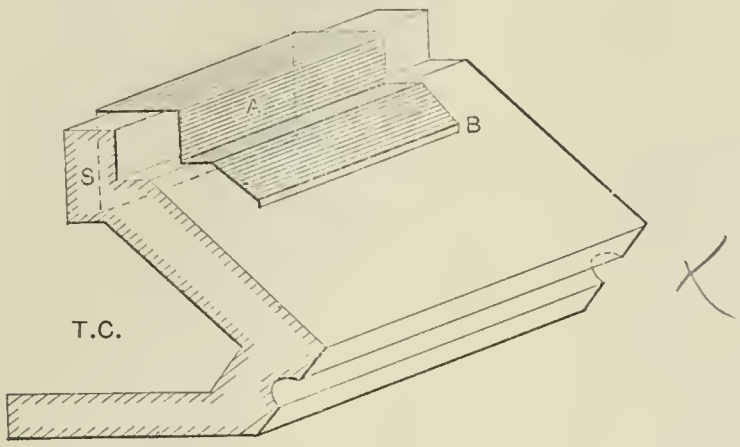


Fig. 2.—Copper Flashing Over Terra Cotta.

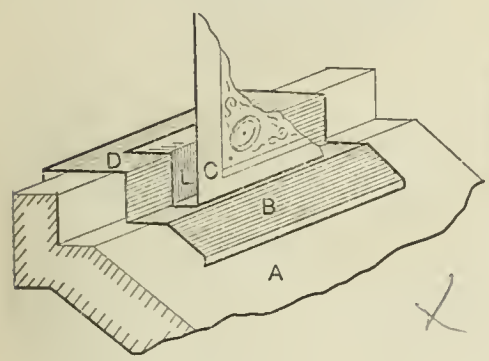

Fig. 3.—Method of Fastening Circular Windows at Bottom.

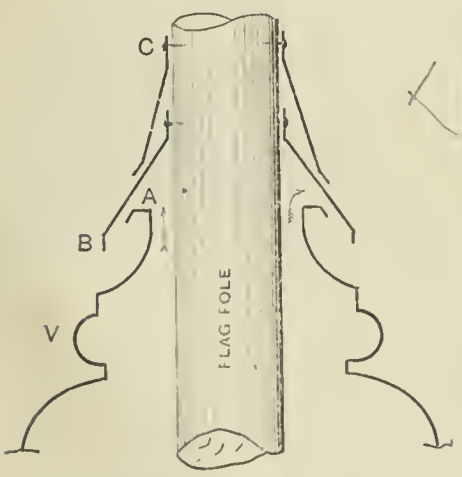

Fig. 4.—Section Showing Water Tight Joint at Flag Pole.

A few words in reference to the color of a slate roof may be of some use to those who have not heretofore taken that into consideration when painting their house. When one has a great body of a decided color on a roof, as green, purple, or red is, they should carefully select some shade that will harmonize generally with their roof. That is the reason that some green slate looks brighter, some purple richer and some red more lively, because either knowingly or unknowingly there has been a judicious harmony carried out, by a correct juxtaposition of color. On the other hand a man may paint his house with precisely the same colors as his neighbor, but there is a something about it that he does not understand; it does not look so well as neighbor Brown's. Let him look at his roof. Five times out of six the roof kills the job. Not because anything is amiss in the roof itself, but because of the want of a little artistic taste in color harmony. Neighbor Brown's house was the right color to match the slate. I have just called attention to this because it is one of the peculiarities I have noticed.

A slate roof lends itself very easily to decoration. I have seen mosaic borders and bands of parti-colored slate which were artistic and striking as a method of advertising. No large firm who have an extensive run of slate roofs should fail to put in their name and trade in lighter colored slates than the body of the roof. It stands as long as the roof, because it is a part of it. No iron or wooden signs to blow down, no paint to wash off, an imperishable signboard. Hence to sum up, a slate roof combines the greatest strength with the greatest endurance; slate if good and put on well lasts longer than the proverbial lifetime. The writer knows of a roof that was slated about the year 1680 in one of the royal dockyards of England. About 25 years ago it was found necessary to pull down the building and build a larger one. The greater portion of these slates were placed on the new building. It was also remarked at the time that very little repairs had been done on the roof during the nearly 200 years it had stood. In any of the old churchyards can be found gravestones, anywhere from one to 1400 years old, made of slate, and some of the letters seem to keep as fine an edge as when first cut. Then, summing up still further, slate is fire proof, and vegetable matter does not easily attach itself, and hence all water running off it is, as far as the slate is concerned, chemically clean, is free from offensive, smell of decayed wood or moss, as is the case with wooden roofs when old. It requires no paint to keep it water proof as does iron, tin or felt. In truth it is a roof that protects without a constant and continual outlay of money to keep it so that it will protect.

The Roofer.

It is a little too early yet for the roofer to be busy on new buildings, but the time until they are ready should not be wasted. The winter always puts a strain on tin roofs and gutters, with its freezing temperature at night and the heat to which the roof is subjected by the noonday sun. Then the ice in the valleys, gutters and leaders is apt to leave them in a condition for repairs. The paint on a roof is liable to crack or scale from the winter strains, and a fresh coat is the only safeguard against rust and ruin. The roofer knows this, but unless he brings it to the notice of the property owners in his locality it will profit him little. He had better make an inspection of the condition of the roofs of his neighbors and furnish a report free than to sit idle waiting for something to turn up. This will give him an opportunity to talk about the quality of roofing and to impress his hearers with the difference between low priced and good roofing. The starvation price of roofing is the complaint of roofers all through the country, and will be until the roofer has talked good roofing in a way that will let the layman understand the great difference that a cent or two will make in the quality of the material used and the durability of the roof.

This is a good season for some missionary work, and if samples of tin of good size and various qualities are carried along with paper between to prevent rubbing they will lend interest to the conversation. There is a vast difference in the quality of roof paints used, and if some of the tin samples are painted with different grades of paint some benefit will be derived. A set of such samples kept at the shop neatly arranged with tissue paper between them and wrapped in a neat paper will impress the customer that there really is something more in tin and painting than the price, which has too long been the prominent feature of roof talk. Some men spend a good many spare hours and odd minutes in getting just the right wording for a postal card or a small circular which at this season they send to those who own roofs or will be buyers in the future. Roofing well done is not the common labor that its price would

often suggest, but is a work in which skill and judgment are required, and some effort should be made to raise the value of good work in the estimation of the buyer and thus lead to its being made more profitable.

Sheet Metal Ornaments.

We show in the accompanying illustrations specimens of sheet metal work made by James White of Brooklyn, N. Y. The examples are taken at random from the extensive assortment manufactured and serve to illustrate some of the work that he does. The leaf ornament, Fig. 1, is deeply stamped and measures 16 x 16 x 27 inches, and the bracket shown in Fig. 2 measures 16 x 28 x 8 inch face. The ornamental sheets of which a section is presented in Fig. 3 are 16 inches wide, while Fig. 4 shows an ornament 16 x 19 x ¾ inches in size. The claim made by Mr. White for this work is that all the designs are original, everything having been carefully modeled by his own artists, being made for some specific purpose and afterward put in stock. Mr. White has also given great care to the manufacture of his cornice trimmings with a view of producing a high grade of stamped work. All the ornaments, of which a very extensive collection is shown in his catalogue, are carried in stock in zinc and are made to order in copper, brass and other metals.

Sheet Metal Ornaments.—Fig. 1.—Leaf Ornament.

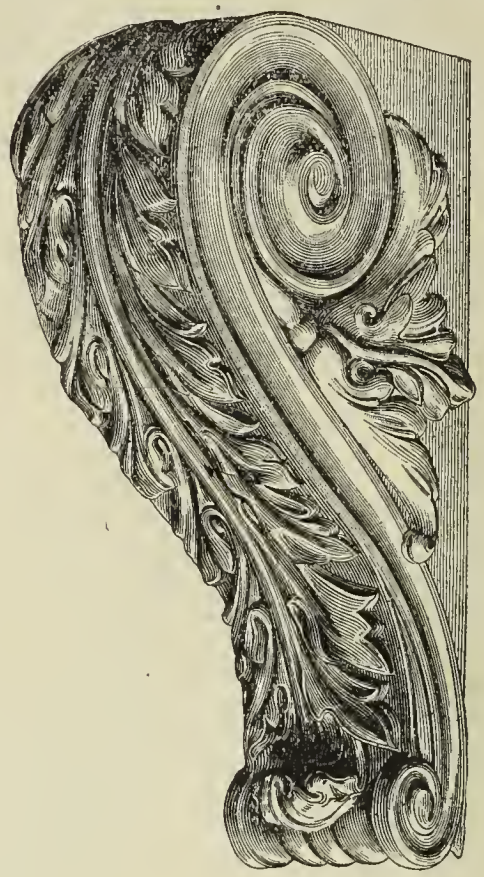

Fig. 2.—Bracket.

Fig. 3.—Ornamental Sheet.

FLASHINGS.

THE OLD JONES BELL FOUNDRY at Troy, N. Y., has been leased by W. H. Squarey and Dr. Billfinger of Elizabeth, N. J., who will, it is reported, use it as a plant for the manufacture of tarred roofing paper.

ALLEN ACKERLY & Co., 171 Vine street, Cincinnati, Ohio, send out circulars calling attention to the "everlasting staying qualities" of their Anti-Rust Japans. One of the testimonial letters is a *fac-simile* letter from the War Department speaking in the highest terms of the Anti-Rust Japans, which have been applied on all the metal roofs of the extensive buildings at Fort Thomas military post. Another testimonial is from a brewery engineer who heartily indorses the material.

WATSON H. BLISS & SONS, Hartford, Conn., are manufacturing the Hill extension ladder in New England. The ladder is made of Canada spruce with oak rounds, and is said to weigh 1½ to 2½ pounds per running foot, and is made in lengths from 16 to 50 feet. The extension part runs inside of the ground section and can be readily separated, making two ladders when desired.

WE LEARN from W. J. Burton & Co., Detroit, Mich., that they are enjoying an improved trade in their metal shingles and tools. During the past ten days they have made shipments of their Eastlake shingles to Chicago, Toledo, Columbus, Texas, California and various points in Michigan. They also are having a better business in gutters and conductors.

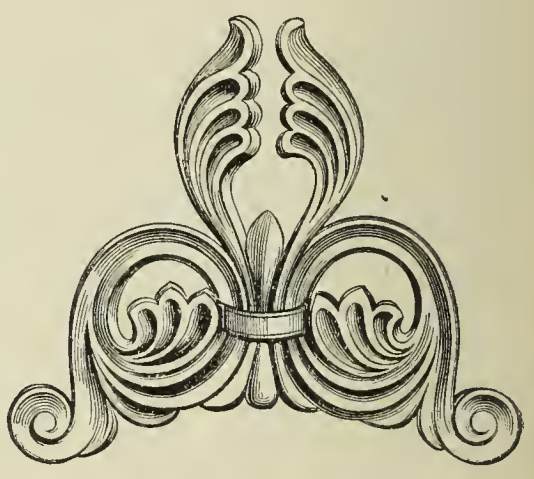

Fig. 4.—Stamped Ornament.

SCHWING & FRISWELL, Bridgeport, Conn., have completed their large contract at Bedford, N. Y., and also a galvanized iron cornice for the Southport Savings Bank. They have also commenced work on the cornices and bay windows on the Atlantic Hotel.

GLOVER SANFORD'S SONS, Bridgeport, Conn., are raising their store building one story and will cover the front with galvanized iron in imitation of stone.

THE UNITED SALT COMPANY, Cleveland, are just completing the rebuilding and enlarging of their works since their fire. They have a very extensive and complete plant. Their buildings are fire proof, frames and covering being entirely of iron. The Garry Iron & Steel Roofing Company of Cleveland furnished the material and erected the entire plant.

JAMES WHITE, 446–456 Adelphi street, Brooklyn, N. Y., has published a catalogue of sheet metal architectural ornaments in zinc and copper, which is a publication that will be of much interest to the roofing and cornice trades and all those who make use of sheet metal ornaments. The publication is in the form of a portfolio, bound in heavy manilla paper, tied at the back with a string and measures 9½ x 6 inches. Altogether there are 80 odd pages in the book, the sheets being of heavy paper and printed on one side only, giving the whole a very handsome appearance. The publication is not encumbered with unnecessary letter press, the only thing being an announcement at the beginning of terms, discounts, &c. The illustrations cover a most extensive variety of handsome work and will be much appreciated by the trade. Accompanying each cut is a number for ordering and particulars of size and price. In addition to the architectural ornaments there are given at the end illustrations of sheet metal pipes, skylight bars, flashings, skylights, fireproof doors and shutters, ash chutes, &c., while the last page carries an alphabetical index of the contents.

THE KANSAS CITY METAL ROOFING & CORRUGATING COMPANY, Kansas City, Mo., have moved from the Builders' and Traders' Exchange to 416 Delaware street, where they have greatly enlarged facilities for handling their steadily increasing business. The building is well adapted to their business, and they will carry full and complete stocks of all goods handled by them.

WE HAVE RECEIVED a circular from P. H. Laufman & Co., Limited, Apollo, Pa., referring to their well known specialty, Laufman's Apollo terne, or leaded sheets, in large sizes, adapted for car roofing, eave troughs, conductor pipe and cornice work. These sheets are made 20 to 36 inches wide and 60 to 120 inches long and from No. 17 to No. 30 gauge. Attention is called to the fact that the sheets are made by oil process and not with acid flux.

BELL'S GALVANIZED WIRE EAVE TROUGH HANGERS, which have been on the market for some ten years, are still growing in favor with the trade. The hanger is made of one piece of heavy steel wire galvanized and is so formed as to be a brace and support to the trough and keep it in shape as well as in place. It is constructed so as to admit of it being placed on the trough and fastened, and the trough hung very quickly and with the expense of the least time and labor. The manufacturers refer to their convenience in shipping, being neatly bunched. The hangers are sold chiefly through jobbers, but samples will be sent by applying to the manufacturers, John W. Bell & Co., Mercer, Pa.

GARA, MCGINLEY & Co., 23 South Seventeenth street, Philadelphia, Pa., send out memorandum pads reminding the trade of their business as roof repairers. At the top of each sheet is an original observation or quotation respecting their business. The back carries a request to "Stick this on your 'phone," and the glue, by which the sticking is done, is all ready for moistening.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

JAMES E. CAMP of Bridgeport, Conn., is building a fine residence which will have a plumbing system and will be heated by hot water.

M. J. DALY, Waterbury, Conn., has just taken a large contract in New Haven for the Winchester Repeating Arms Company to construct a fire hydrant system, 1100 feet long, of 8 inch cast iron pipe.

ASHTON & GARRITY, Waterbury, Conn., have the contract for the plumbing in the new residence of Rev. J H. Duggan.

THE GRISWOLD, RICHMOND & GLOCK COMPANY, Meriden, Conn., are finishing up their big contract for placing the indirect steam heating pipes in the Old People's Home. The contract is a very large one, involving the working up of more than 20,000 pounds of galvanized iron.

GEO. L. MCQUIGG, Flint, Mich., has closed a contract with Father Murphy for a hot water heating system for his residence; also for a hot and cold water plumbing system.

THE Board of Public Works of La Crosse, Wis., will advertise for proposals for heating and ventilating the new school buildings on the plans and specifications of the Sturtevant Company.

THE Board of Supervisors of the Almshouse at Canton, N. Y., are about to expend $1500 for some system of heating and ventilation to be selected.

THE contract for plumbing the new Merrill Block has been let to Bovett & Noble, Pittsfield, Mass.

CLARK ELLIS & SONS, Milford, Mass., have been awarded the contract for the plumbing at the new school building.

KRUSE & DEWENTER, Indianapolis, Ind., have been awarded the contract to furnish the heating and ventilating apparatus for the new medical college in that city, and for the High School Building in Pendleton.

POSTMASTER DAYTON has received word that the contract for reconstructing the entire plumbing of the New York City Post Office was awarded to Blackburn & DeGraw of New York, the lowest bidders, at $28,500. The work is to be completed in 90 days from the signing of the formal contract, which will be about April 3, and about April 15 advertisements will be published for arranging the ventilating system of the Post Office.

R. J. O'CROWLEY, Newark, N. J., is doing the plumbing in a house for D. A. Robinson.

THE heating and ventilating apparatus for the new school house at Milford, Mass., will be supplied by the Fuller-Warren Company, Troy, N. Y.

BARLOW BROS., Waterbury, Conn., have commenced work putting in the heating apparatus, which will be run by steam, in the new town hall at Watertown.

CROOK, HORNER & Co. of Baltimore, Md., have been awarded the contract for furnishing the steam heating and power plant for McMahon Hall of the Catholic University at Washington.

J. H. COGAN & Co., Augusta, Maine, have just taken the contract to furnish the residence of Hon. J. H. Manley, Hospital street, with one of the Richmond steam heating systems.

THE CONTRACT for plumbing the new block to be erected by Edson J. Hill, on Hill's avenue, together with contracts for gas piping and steam heat, have been awarded to Lee Bros., Concord, N. H.

BIDS will be received at the Board of Education at 713 Filbert street, Philadelphia, until April 2, for a new boiler in the Mt. Vernon street school, alterations and additions to heating Adamson and Fairview schools, also for heating and ventilating the Curtin school, the addition to the Fair Hill school, the Disston school, and the school at Forty-sixth street and Woodland avenue.

THE DEPARTMENT OF PUBLIC INSTRUCTION, Brooklyn, N. Y., will receive proposals at the secretary's office, 131 Livingston street, until April 2, for heating and ventilating the new school No. 108. Plans and specifications may be obtained at the office of the chief engineer in Red Hook lane. Bids will be received for steam and the combination of steam and hot water separately.

SEALED PROPOSALS will be received by Howard School Board until noon April 17, 1895, for a system of heating and ventilating Park school, Ligonier street, Sixteenth Ward, Pittsburgh, and old buildings of Bloomfield school, Ella street, Sixteenth Ward. All bids should be addressed to John H. Rhine, Secretary, 317 Edmund street, Pittsburgh, Pa.

JAMES BIRNEY, 2002 West Madison street, Chicago, has the contract for the plumbing and drainage in the flat building of Alfred Halmberg, on Marvin avenue.

HARRIS BROS., 3239 State street, Chicago, are to do the plumbing and drainage in the flat building of John M. Gartside, 4327 Drexel boulevard.

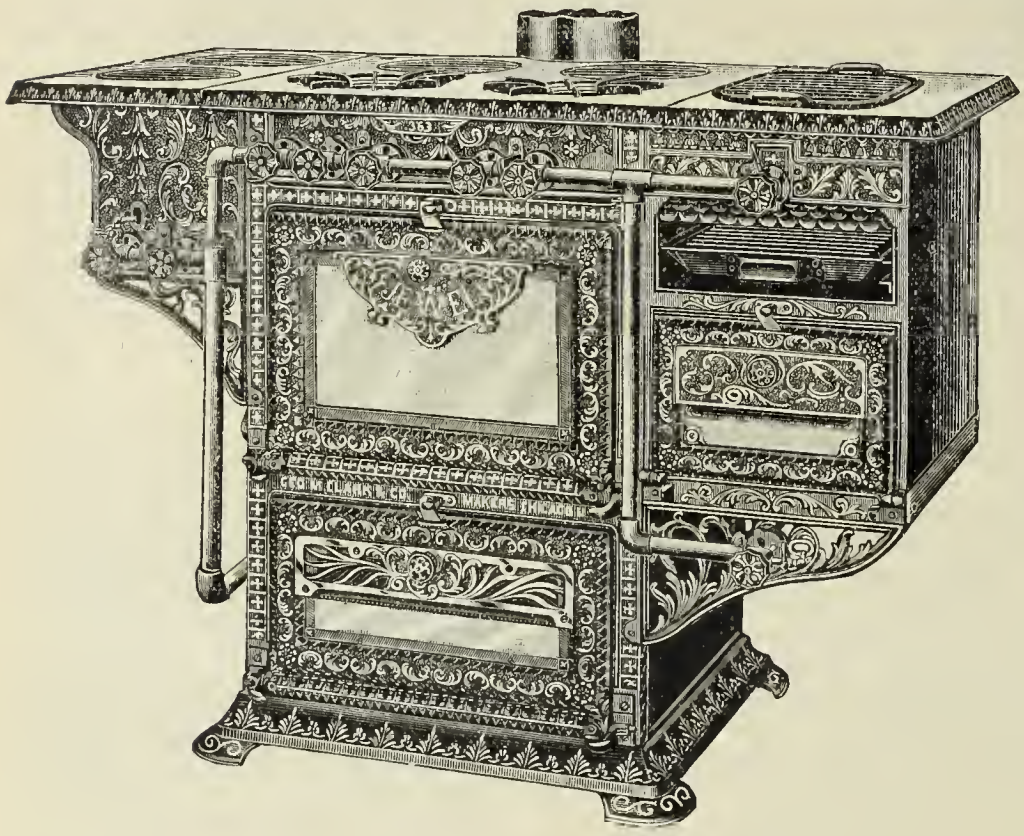
JACOB KIESSLING, 1199 Milwaukee avenue, Chicago, has contracts for the plumbing and drainage in the flat buildings of L. Ludke, 726 Dudley street, and H. Rether, 699 Davis street.

THOMAS WIXTED, 5553 South Halsted street, Chicago, has the contract for the plumbing and drainage in the residence of J. Elben, 5614 Carpenter street.

TAFFE & LEIBRANDT, 3025 State street, Chicago, have the contract for the plumbing and drainage in the flat building of Charles Leibrandt, 5312 Indiana avenue.

HANLEY & CASSEY, 21 Quincy street, Chicago, have the contract for the plumbing and drainage in the flat building of A. S. Bradley, 5453 Monroe avenue.

PETERS BROS., 1726 North Clark street, Chicago, have the contract for the plumbing and drainage in the flat building of A. Lemmert, 221 Baxter street, Lake View.



GEORGE HAUSLEIN, 1179 North Halstead street, Chicago, is to do the plumbing and drainage in the store and flat building of E. Behm, 805 Clybourn avenue, and in the flat building of E. C. Yerlon, 964 Perry street.

CHARLES P. MARTIN, 6406 Laflin street, Chicago, is to do the plumbing and drainage in the flat building of M. Larson, 6353 Morgan street.

THE RETAIL STORE.

New Jewel Gas Stoves.

George M. Clark & Co. of 149–161 Superior street, Chicago, Ill., have added to their already extensive assortment of gas burning appliances for heating and cooking purposes a new line of Jewel gas ranges. At present two styles are being manufactured, one of which is intended for using natural gas and the other for artificial gas. The latter style is known as No. 363, and is represented in general view in Fig. 1 of the accompanying illustrations. It has four burners in the top surface, two lids over the water back and a griddle cake baking plate with reversible burner.

New Jewel Gas Stoves.—Fig. 1.—Gas Range No. 363.

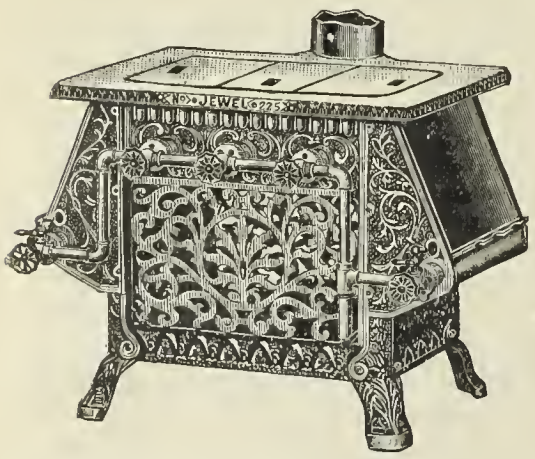


Fig. 2.—Jewel Laundry Stove with Iron Heating Devices.

There is also a broiling chamber, a baking oven and a roasting oven, the base of the latter being made removable. The decorative features are of an effective character and the construction is first class throughout. Another novelty which the company have this season added to their assortment is shown in Fig. 2. This is the Jewel laundry stove of a hight just right for a wash boiler, the top being large and furnished with three removable solid lids. The heat is furnished from three No. 10 burners directly under the lids referred to. Upon each side is constructed an iron heating device having a No. 10 burner inclosed, these burners being lighted with a pilot light. The flame of the iron heating burners plays against the slanting top of the plate, giving, it is said, very satisfactory results in operation. Each side has a capacity for three irons, the ledge at the base which holds the irons having openings to receive the points of Mrs. Potts' and similar irons. The Jewel laundry stove is constructed of cast iron throughout, has a top surface 24½ x 18¼ inches, a top opening 18 inches wide by 12 inches deep, and an iron heating plate 13¼ inches wide by 9⅛ inches high. The extreme width of the stove shown in Fig. 2, including the iron heating wings, is 29 inches. The manufacturers furnish one style of this stove without the side heating attachments. The company refer to these stoves as being useful for many other than laundry purposes. They have also brought out a new line of Junior stoves made in three styles and with six different arrangements of burners, one of which is shown in Fig. 3 of the cuts. These are offered under the name Jewel and are 22 inches wide by 22½ inches deep and 5 inches high.

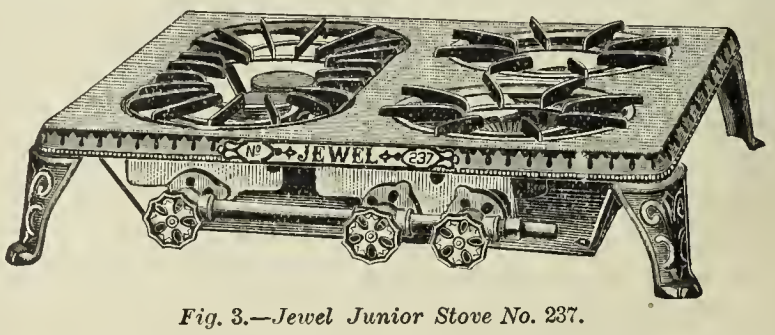

Fig. 3.—Jewel Junior Stove No. 237.

Guardian Fire Extinguisher.

The accompanying cuts represent a fire extinguisher being put on the market by Randolph & Clowes, Waterbury, Conn. The vessel in which the fluid is held under pressure is a seamless copper shell, in sizes to suit, from 2 to 5 gallons. One of the special features in the extinguisher is the two separate and distinct methods of operation. One of these is an air pressure, which, it is stated, is automatic. The other, it is stated, is a never failing pump, which is auto-mechanical. If from any cause the air pressure should fail to throw the fluid, the pump can be called into use. The discharge pipe or tube, to which the hose is attached, and through which the fluid must pass, is a single, double acting piston pump, of the water packed piston type. It is explained that the mechanism of the pump is such that when the piston or handle of the pump is turned to release the pressure the same movement turns the receiving valve upon its seat once and a half around, so no time is lost. If the internal pressure of the

Fig. 1.—Guardian Fire Extinguisher.

compressed air is weak, or lost altogether, the necessary force is added by working the piston up and down a stroke of from 6 to 8 inches. The pump immediately fills and force is supplied, it is remarked, to throw a solid stream 40 feet. The pump is so constructed that the receiving valve is kept closed during any period of idleness. It is explained that, while the extinguisher stands ready charged for immediate action, the pump remains perfectly dry, and that should the extinguisher be subjected to a temperature cold enough to freeze the contents of the vessel, the pump will be found in working order, as there is nothing in it to freeze. The point is made that all important mechanical parts of the extinguisher are so arranged that they do not come in contact with the fluid until the extinguisher is in operation ; that the tank is so arranged that the compressed air is kept away from the fluid connection by casing it in a compartment by itself, and that the air pressure does not come in contact with any connection of the extinguisher. The manufacturers state that the fluid for extinguishing fires is a combination of chemicals furnished them by one of the most celebrated chemists of the country, that it will not deteriorate or become useless with age, that it will not corrode metal or stain the finest fabric, where the colors are

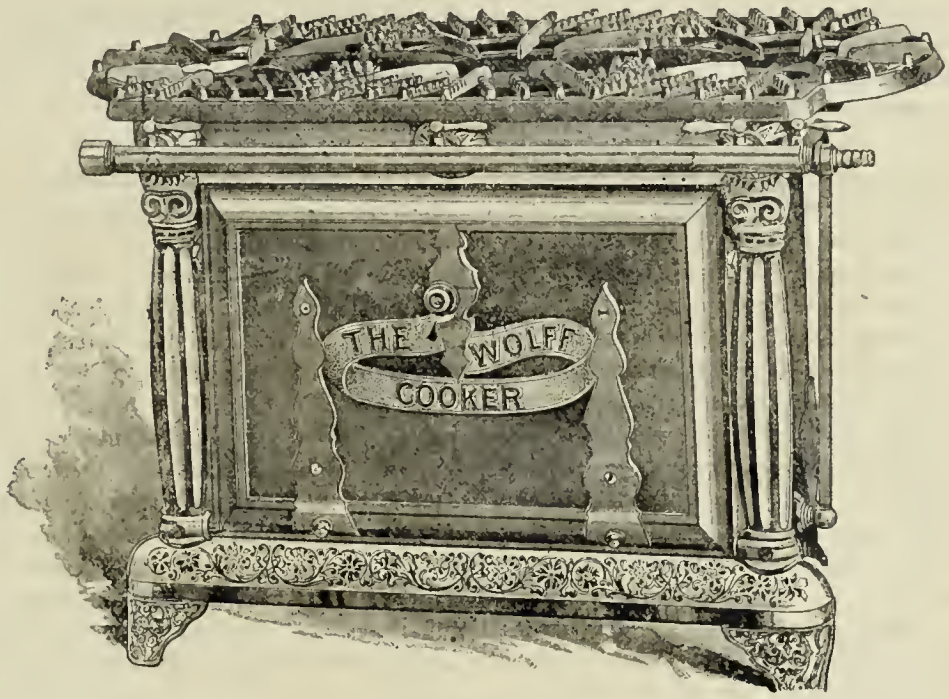

Fig. 2.—Guardian Fire Extinguisher with Gauge.

not fugitive, that the extinguishing qualities are exceptional and that by actual test it has stood a temperature of zero without freezing. The manufacturers furnish the compound in packages, securely packed for shipping, with directions for mixing it. A reliable pressure pump that will not rust or corrode is also furnished. The manufacturers claim that by repeated and expensive experiments they have produced a thoroughly practical and reliable fire extinguisher.

The Wolff Cooker.

A new candidate for favor with dealers in summer goods is the Wolff Cooker, made by the Wolff Gas Radiator Mfg. Company, 164 Franklin street, New York, and which is shown in the accompanying picture. The cooker is new in design and construction, being light in weight so that it may be easily transported, and is compact, so that it is capable of doing a great deal of work and occupying but a small space. There are three burners that may be used for cooking on the top, two for cooking exclusively on the top, and the third for broiling in the oven as well as cooking on top. This is a new application, and the construction is novel. The top of the range is well perforated to permit the heat of the burners passing up around all vessels which are set upon it, and is so constructed that vessels may be moved around upon it without lifting up. The broiler burner is placed under the center cooking hole and is of an oblong ring construction, the gas burning only on the inner side and under the fine fret work casting, which has projecting pins on the under side.

The Wolff Cooker.

This casting is heated red hot and radiates heat against the food to be cooked. On dropping down the oven door a rack is seen, which is placed in the upper part of the oven on which the broiler sits. Another burner of the same character as the cooking burners on the top of the stove is placed under the center of the oven, and it is said that the cooker is an excellent baker. The oven is 10½ x 16 inches and 10 inches in hight. The cooking burners and the burner under the oven are rated to burn 10 feet of gas per hour, the broiler burner burning 12 feet. All the burners are provided with an adjustable air mixer to meet the requirements of gas of different qualities and furnished at different pressures. The castings of the stove are of a fine finish and the body is constructed of Russia iron. All the castings on the front of the stove and the name plate are nickel plated, giving the stove a very attractive appearance.

MEMORANDA.

JEAN L. REED, representing the Rochester Stamping Works and the Robeson Cutlery Company, 141-147 Jones street, Rochester, N. Y., uses a black card, printed in gilt, bearing five verses of praise to the "Rochesters," referring to their line of goods. The card also bears a cut of a copper tea kettle, and allusion is made in the poetry to the many different household goods made of sheet metal by the firm.

IT IS NO UNCOMMON THING for stove dealers to receive curiously worded orders through the mail, but occasionally one is received of such a unique character as to make it more than ordinarily conspicuous. A stove firm doing business in one of the smaller towns in Maine recently had brought into their office by an out of town stage driver an order reading as follows: "ples geet me A wash bolar Ass cheep Ass you Can A bout 100 25 ore 100 50."

E. M. LAW of West Newton has bought A. H. Lyman's stove store, at Athol, Mass., and will continue the old business and add plumbing. He was formerly in Mr. Lyman's employ.

FRED D. HARRIS and his brother Edward H. Harris have formed a copartnership and will conduct a tin and repair shop on West Elm street, Oneida, N. Y. Edward H. Harris has been in the employ of Conley Brothers at their stove store on Madison street. The firm will make a specialty of furnace work.

A. P. BATEMAN, Winchester, Mass., continues to make improvements to the front of his tin shop store. He has built two large show windows.

THE BEARDSLEY MFG COMPANY, Cleveland, Ohio, distribute blotters advertising some of their specialties, which include fire shovels, Economic roasters, grain measures, flour measures, cans, tanks, kegs, &c. Several of the goods are illustrated on the blotters.

HORTON, GILMORE, MCWILLIAMS & CO , 172 to 176 Lake street, Chicago, have been appointed exclusive Chicago agents for the Meyers Putz Cream Liquid Metal Polish and the Putz Extract for polishing. These preparations have a worldwide reputation. The first named is not only designed for metals, but also for wood work and leather. The other is for all kinds of metals except silver ware.

L. & I. J WHITE, Buffalo, N. Y., have opened an office at 48 Centre street, New York, in charge of S. J. White. One of the walls of the office is decorated with a display of edge tools that was exhibited at the Paris Exposition; and the sign that was used over their exhibit is also an attraction in the office. Against a black cloth background in an oak frame of shield design edge tools of various descriptions are shown. They include ice axes, firmer and socket chisels and gouges, draw knives, butchers' cleavers and knives and ship carpenters' tools. Another piece of work on exhibition is a leather splitting knife blade 92 inches long, of superior cast steel and sharpened to a razor edge.

STOVE TRADE NOTES.

The Stove Secretaryship.

The leading members of the stove trade who take an active interest in the affairs of the National Association of Stove Manufacturers are realizing more strongly from day to day the loss sustained in the death of D. M. Thomas, the late secretary. His peculiar fitness for the position was, of course, recognized by the great majority of the members, as shown by the very cordial support which they gave him. Yet Mr. Thomas' warmest supporters now acknowledge that even they fell short of measuring him at his true worth. The best evidence of his superior qualifications is the fact that so far no candidate for the succession has been brought forward who commands any considerable following. Names have been mentioned in connection with the place, but thus far there has been no crystallization of sentiment in favor of any of them. Available men who can satisfactorily fill the position of secretary of the National Association may be found without a very prolonged search, but the great difficulty encountered is in getting a man who can at the same time take up the extremely important work of the Stove Founders' National Defense Association. The two associations are not identical, although largely composed of the same individuals. For special reasons it is desirable that the same person should serve as secretary of both associations. In the case of Mr. Thomas there was no thought of separating the work. He thoroughly comprehended the functions and the special fields of labor of both organizations, and to be elected secretary of one meant for him the secretaryship of the other.

In the discussions and correspondence upon this subject which have so far taken place among the leading members, several names have been suggested of persons who would admirably fill the position of secretary of the National Association. They possess the literary qualifications desirable for the incumbent of this office, and some of them have such attainments of a very high order, which would make them in this respect worthy successors of the deceased secretary. They are also familiar with the commercial side of the stove business, and would by their originality and great mental force assist materially in making the annual conventions interesting and instructive. They would be able to extend the membership of the organization by the persuasive powers with which they are gifted, and their tact would soften antagonisms and prevent misunderstandings. But, thus far, no one in a position to accept the secretaryship has been brought forward who combines with all these qualifications the practical knowledge of stove molding which he must possess in order to successfully conduct the work of the Defense Association.

This part of the secretary's work calls for very peculiar qualifications. The right man in this position can render inestimable service to the stove trade in arranging differences between manufacturers and their workmen, so that serious strikes are prevented. It is true that the other officers of the Defense Association are practical men, who are versed in all the technicalities of stove molding, and are therefore competent to adjust differences that may arise. They by no means abdicate their power in favor of the secretary and relegate to him all their functions. But they have their own business to manage, and cannot travel at a moment's notice to a distant town to hear the fine points of a controversy over the piece price to be allowed a molder for turning out some new shape of a stove part. This is the function of the secretary, and when he appears on the ground he must be so competent to judge the value of the work, and so able to prove the justice of his position, that his fairness will commend itself to both the contending parties. This involves not only the knowledge that comes of years of experience in running a molding shop, but also much hard study in becoming familiar with all classes of work, all varieties of stoves and the peculiarities of the several sections of the country. It is not every manufacturer who can dissect a range made near him with a similar one made 1000 miles away, and fix a fair molding price on every piece of the latter in compliance with all usages which have grown into the trade in the section in which the second range is being turned out. But it would be well if the secretary could do so. He would be a tower of strength to the manufacturers, as he would surely gain the respect and admiration of the workmen, who are intensely jealous of their rights, but are usually quick to acknowledge the justice of a perfectly fair proposition.

The task of selecting a secretary is thus shown to be extremely difficult. Yet the qualifications are not rare in the stove trade. Quite a number of men could be designated any one of whom would make a very capable secretary. But they are not available, being so situated that the office has no attraction for them. The problem is to find an available man with the necessary qualifications. As the time for the annual convention is approaching this is a question of very great interest to the stove trade, and therefore one which many of our readers would be pleased to have an opportunity to discuss. They may have candidates whose names they desire to bring to the notice of the trade. We shall be glad to print communications on this subject.

Foundry Mixtures for Stove Castings.

The following interesting letter discussing the question of foundry mixtures that appeared in *The Metal Worker* March 16 is sent us by C. A. Meissner of Birmingham, Ala.:

I note a letter in a recent issue in which a foundry manager complains of a certain mixture as not having given good results. He says this mixture was:

39 per cent. No. 2 Foundry, Southern pig.
38 per cent. No. 3 Foundry, Southern pig.
16 per cent. No. 1 Soft, Southern pig.
7 per cent. Jackson County Silvery, 8 per cent. silicon.

With this he used his own scrap, also 30 pounds limestone per charge. He states resultant iron is very dirty and "rusty," that it cannot be skimmed clean, that the rust gets into the molds and makes mean looking castings, and asks opinions of others as to what is the trouble and how to overcome it.

Would you pardon me if I make a little good natured criticism? Our foundry friends make it often a very difficult task for the furnacemen and chemists to help them out of their troubles, from the fact that so often they forget to give them the very data which are absolutely essential to a study of the difficulty. We have here the percentages given, and that is all. There is no intimation as to what section this Southern iron comes from—Virginia, Tennessee or Alabama—which might be a guide to the nature of the iron. There is no analysis of the iron given except the Jackson County, without which we can hardly reach an intelligent conclusion, and he does not state the amount of scrap used nor the nature of the coke, both of which are important items. I do not want to find fault in any way, but merely call the attention of our foundry friends to the need of being a trifle more specific when such matters come up, and I am sure there are plenty of men all over the iron districts who can very quickly give them a clear idea of where the trouble is to be looked for.

As I am reasonably familiar with Southern and Northern irons, permit me to make a rough guess at his troubles and give my reasons for it. I think his mixture is too soft, too high in silicon and probably too high in phosphorus. Every iron he has there is liable to be a high silicon iron, as almost all South-

ern coke irons, except from the brown ore fields, tend to be soft and fluid rather than strong, and even those of the brown ore districts share this property to a large extent.

Take the average Southern iron and analysis will be about as follows:

	Per cent.
No. 2 Foundry, silicon	2.25 to 2 60
No. 3 Foundry, silicon	2.00 to 2.400
No. 1 Soft, silicon	2.75 to 3 75
Phosphorus will average from	0.450 to 0.700

The Jackson County iron will probably run 1 per cent. in phosphorus.

To this he adds his own scrap, which, if made from repeated charges of this mixture, will naturally be high in silicon and phosphorus, and he apparently has no strengthener whatever in his mixture. Of course some of his Southern iron may be a low silicon and phosphorus brown ore iron, in which case the above does not hold altogether good; but even then I should say that he had no need for the Jackson County Silvery, in so far as his Southern No. 1 Soft would be bound to take care of any other Southern iron he could get and give necessary softness and fluidity. Therefore my judgment would be that for his purpose, stoves, he should leave off the Silvery iron and try the mixture without it. If he uses no strong Southern brand—but they are all high silicon and high phosphorus—he could readily buy a strong Southern iron from any of the Southern companies by specifying his needs, for all of them are now going into the matter of analysis most earnestly and are able to meet any such demand, as they all carry strong iron as well as soft iron in their yards.

It may be interesting to note the probable average of this mixture in silicon and phosphorus, based on actual averages of Birmingham iron:

	Silicon. Per cent.	Phosphorus. Per cent.
39 per cent. No. 2 Foundry	2.40	0.550
38 per cent. No. 3 Foundry	2 25	0.550
16 per cent. No. 1 Soft.	3.25	0.550
7 per cent. Jackson County Silvery	8.00	1.00

This would give a mixture of 2.87 per cent. silicon and 0.581 per cent. phosphorus, which with probably high silicon and phosphorus scrap would be liable to make a mixture entirely too rich for his use and cause his troubles.

From HENRY HEYER, Capital City Stove Works, *Columbus, Ohio*—In my opinion, the correspondent who wrote *The Metal Worker* March 16 asking for information about foundry mixtures is using too much limestone. I use only from 6 to 10 pounds per ton of iron as a flux and with good results. I use only Frick's coke. I have used several kinds of coke, but find that is the best in the long run. I would furthermore suggest to your correspondent to cut the No. 3 Southern 18 to 20 per cent., and add this 18 to 20 per cent. to No. 2 Southern. I do not put much faith in No. 3 Southern foundry iron for stove plate, although some may have had good results with it. If these suggestions do not help your correspondent I will be glad to give him my mixture if he will apply for it.

A Pennsylvania correspondent, noticing the article on foundry mixtures for stove castings in *The Metal Worker* of March 16, says: "It is difficult to comply with the request made, as there is but little ground to work on. It is evident that some iron that should not be used is in the mixture, and the proper thing to do would be to get a chemical analysis of each iron used. There are Southern irons which in the pig look first class in every respect, but when used look similar to silver gray and have given our foundrymen considerable trouble. The usual method of getting over the trouble is to drop the iron which causes it out of the mixture altogether. There is no reason why any silver gray iron should be used if the other irons are all right. There is no trouble whatever in getting a first-rate mixture for stove plates with three irons, and a mixture that will run soft, strong and fluid. Such a mixture can be secured with only 3 per cent. of silicon instead of 8 per cent."

A Furnace Association Needed.

Chicago furnacemen state that the furnace trade of that city is in a deplorable condition. Manufacturers and representatives of other manufacturers have been waging relentless war upon each other until prices have been so seriously cut that ruin seems to be inevitable if a change is not speedily made. The prices at which heating contracts have been recently taken are so absurdly low that they almost challenge one's credibility. It would perhaps unduly demoralize business in other sections to quote them. It is enough to say that the whole work of installing a furnace system in an eight-room house is now done for the price of the furnace alone two years since. It is by no means unusual for a conscientious furnaceman to find that the competitor who captured a job was from 20 to 33⅓ per cent. cheaper. The difference is so great that arguments as to character of work, efficiency of apparatus, safety from fire, &c., have little weight in influencing owners to reject the lowest bidders and take one of the dearer ones.

It follows as a matter of course that these very low prices mean inferior work. The furnaces cannot be properly made, the roughing in cannot be done with the necessary precautions against danger from fire and all the work must be done hastily and in the most slighting manner. Reductions in cost of material have been considerable within two years, it is true, but they have by no means been so great as to cause the difference prevailing between prices now and then. Furnacemen who expect to do good work confess their utter inability to meet the conditions existing round them. They are of the opinion that the only remedy for this state of affairs is the formation of an association of the manufacturers and manufacturers' representatives in and about Chicago to maintain fair and equitable rates on their furnaces and to control, as far as they can, the reckless bidding on contracts.

It is to the interest of furnace manufacturers to discourage these extremely low prices and not to countenance them by making special concessions at the solicitation of those contractors who can only secure jobs when they are lower than any one else. It is no credit to a manufacturer to have his name on a furnace forming part of a poor heating system, because the first part of a heating job to be attacked when it fails to give satisfaction is the furnace. A few furnaces of a particular make thrown out in one neighborhood may mean the loss of all patronage in that locality for many years.

An organization of furnacemen would undoubtedly be found of much benefit in correcting disturbances of this character, because men cannot get together and talk over business matters without making an impression on each other in the direction of greater consideration and fairer treatment. Perhaps in no other branch of business to-day is there such a total lack of intercourse and complete disregard of each other as in the furnace trade. Every other line has its national or local organizations which bring the members together at stated periods, but the furnacemen go their several ways as though contact with one another was to be especially avoided. Can they not be brought together?

The Oil Stove Market.

In the old buildings of large cities, which are generally well populated, the heat attending the use of coal for cooking in summer brings a desire for something less heating. Frequently these buildings are not piped for gas and the insurance interferes with the use of gasoline. This is no small market and the oil stove at present seems to monopolize the trade, though patented fuels have had a passing favor. The old stove of the past is barbarous compared to the clean, convenient, easily manipulated, high power oil stove of to-day, which holds its own in the line of progress. The modern oil range is attractive in appearance and is found in the suburban districts in the kitchens of many who are well to do, as it is capable of meeting all the requirements imposed upon it. The kitchen is by no means its only field, for when the heating stove in many shops is dispensed with the oil stove is relied upon to furnish the heat required for a myriad of purposes. The fuel being inexpensive and the heat readily controlled the oil stove in all thickly inhabited districts is destined to play an important part.

H. WATERMAN, manager of the New York house of the Cleveland Foundry Company, 107 Beekman street, is distributing among the trade a catalogue devoted to gas and oil cooking stoves.

FRANK P. GLAZIER of the Glazier Stove Company, Chelsea, Mich., is the assignee of a patent recently granted to A. R. Welsh of that place for certain improvements in oil stoves. The invention consists in the peculiar construction of the base and of the drip pan and its support. The arrangement is such that the ordinary roller base, usually employed where a drip pan is used, is dispensed with. The claim is made that the construction employed is very simple and cheapens the manufacture of such stoves.

Electric Cooking.

English electricians deserve much credit, says the *Despatch*, for the practical way in which they have solved many of the problems arising out of developments in electrical cookery. A well-known writer on the chemistry of cooking has given it as his opinion that the perfect arrangement for an oven would be the radiation of its heat from all sides. This is now done in an electric oven which is having a large sale in London.

The process is said to produce a cooked meat that is absolutely wholesome and extremely appetizing. There is no combustion whatever in the oven, and the food, being cooked in a pure atmosphere, cannot possibly be tainted. The heat is turned on at any part merely by the movement of a switch. It is produced in ide the oven, and is so conserved that after the oven is once made hot, what is requried to carry on the process is little more than that sufficient to make up for slight leakages. The electric oven can be put on the kitchen dresser when needed, and it throws off, practically, neither heat nor smell.

Tabulated lists are provided from which, the weight and description of the joint being given, full instructions are derived as to the time and temperature of the required cooking. Roast mutton takes a temperature of 330° F., beef 340° and veal 350°; and a heat of 370° is needed to give puff pastry its desirable tint and consistency. The comparative coolness of the outside of the oven is a singular feature; as a *chef* remarked at a recent dinner: "You could sit on the oven while you roast inside."

ODD PLATES.

A. Weiskittel & Son of Baltimore, Md., are favoring their friends in the trade with a very attractive poster, which shows some of their leading specialties. The central feature of the design, which is lithographed in colors, is a kitchen interior, showing a Fire King cabinet gas range in operation. In the upper right hand corner are vignettes of a two burner hot plate and gas broiler, while in the lower left hand corner is a four-tube gas radiator and an open fire place fitted with a gas log. There is also shown a bird's eye view of the works of the concern named. The make up of the poster is rich and effective, and when displayed in the store of the dealer cannot fail to attract attention.

The Danville Stove & Mfg. Company, Danville, Pa., are about placing on the market a hot plate for gas in three sizes, a line of cheap furnaces and also a four-hole range in two sizes under the name of the Model Beaver.

A communication was received recently by a manufacturer of gasoline stoves from a consumer who had used a stove of their make for several years, in all seasons, for cooking. It contained the remarkable statement that during the period of the coldest weather we have experienced this winter his fuel bill for cooking for a family of five persons was but 15 cents per week.

The Carton Furnace Company of Utica, N. Y., have just completed their new foundry building, which stands upon the site of the one that was damaged by fire about five weeks ago. The new structure is 54 x 90 feet in size, half of the building being two stories high and fire proof throughout. The structure is of brick with a truss roof, the doors being fire proof and the shutters covered with tin. The interior is lighted from both sides as well as from a skylight. These dimensions are considerably in excess of those of the old building and give additional molding accommodations for 10 men, making 55 in all. The cupola is 16 x 54 feet and the equipment throughout is of the most modern type. The plant is now running with a force of 125 men. The cost of the rebuilding and improvements is said to reach nearly $10,000, and to accomplish so much work in such a short space of time is a credit to the enterprise of the management. The work was done under the supervision of John B. Jones, the secretary of the company.

The A. J Lindemann & Hoverson Company of Milwaukee, Wis., have recently issued from the press an illustrated price-list of stoves and sheet metal goods which they manufacture. The little volume consists of 64 pages, profusely illustrated, and is bound in colored paper covers with gilt side title. Since the last catalogue was issued the company have nearly doubled their facilities for manufacturing gas and gasoline stoves and their entire line has received many additions as well as improvements. The opening pages are given up to the L. & H. Juniors, shown in a variety of styles and sizes; after which we find the L & H. single generator cabinet stove; the L & H. Ideal, shown with and without step, and the L. & H. Process, an illustration of which appeared in these columns not long since. The latter portion of the catalogue considers the L. & H. Grand Cabinet ranges for burning gas; the L. & H. Gem, together with lamp stoves, ovens, oil heaters, torches, elbows, coal hods, stove pipe, &c.

The Plymouth Foundry Company of Plymouth, Mass., have issued from the press an attractive catalogue of 48 pages illustrating the leading specialties they manufacture. The Plymouth range is made in 70 different styles and sizes and is adapted to meet all reasonable requirements. The catalogue also gives attention to the Crown Royal six-hole range. made in several styles and sizes; the Royal Grand, a first class construction embodying the modern features; the Art Royal, the Prize Royal and the Dexter ranges. The heating stoves are represented by the Royal Grand square parlor heater, the Art Royal sheet iron cylinder surface burner, the Prize Royal, the Plymouth Parlor, the Champion, a neat wood box stove, and the Radiant, a cheap cannon. In the opening pages of the catalogue there is a brief description of Plymouth Rock, the National Monument to the forefathers, Pilgrim Hall and the plant of the Plymouth Foundry Company.

Probably the largest single shipment of oil cook stoves ever made in this country was that recently sent out by the Novelty Mfg. Company of Jackson, Mich. The train consisted of 15 freight cars, the goods being consigned to Butler & Johnson of Syracuse, N. Y. The firm named removed only one carload of the stoves to their own warehouse, the remainder being reshipped to customers throughout the State. W. B. Johnson of Butler & Johnson stated to a representative of a Syracuse paper that the consignment mentioned would not be sufficient to meet their season's requirements, and that he expected before August 1 to receive at least 25 additional carloads. It is stated that last season the firm sold something over 15 carloads, and the demand this year is far ahead of that a year ago.

Luther & Lederhos, 9-11 Desbrosses street, New York, are issuing to the trade their spring catalogue for 1895. It contains 28 pages devoted to gas and oil cooking appliances Some new sizes have been added to their Enterprise cabinet gas range, some sizes of which are made with gas water back. This is followed by several pages devoted to gas hot plates, the newest being made with two, three and four burners setting up on high feet. They also show a gas water heater to be used in connection with kitchen boilers. These are followed by some tailor and laundry stoves and a plumbers' solder furnace, several pages devoted to oil stoves of different character, and a line of Enterprise lamp stoves. The last pages in the book are devoted to gas stove appliances and equipments.

The Cincinnati Steel Range & Furnace Company of 153 West Fifth street, Cincinnati, Ohio, have recently issued a circular letter to their friends in the trade in which attention is called to the lines of high grade kitchen outfits manufactured by them. These outfits are referred to as embodying the latest improvements and as being adapted for first class hotels, clubs, *cafés*, public and private institutions, &c. The outfits consist of Burton steel ranges, French broilers, steam tables, carving tables, plate warmers, coffee and tea urns, bake ovens, steam dish warmers, jacket kettles, cake griddles, waffle and laundry stoves, copper ware, &c. These goods are constructed in a substantial manner according to the most approved plans and the manufacturers state that they are prepared to furnish complete kitchen outfits and guarantee entire satisfaction in all cases.

J. D. Marvin, the New York representative of Rathbone, Sard & Co., at 254 Water street, New York, has a "Snap" which he hopes will become popular with the trade. Those who are interested in an up-to-date summer range should stop in to see it.

Hugh Davidson has accepted the position of foreman of the Clinton Foundry of Fuller & Warren Company, at Troy, N. Y., to succeed the late John Thompson, who died recently. Mr. Davidson has for 25 years been foreman of the Empire Foundry, and is in every way competent for his new position.

The Excelsior Steel Furnace Company, manufacturers of furnace fittings, are now occupying the entire building at 38 West Monroe street, Chicago. Their business has grown remarkably during the short time that has elapsed since its establishment. The building occupied consists of six floors in addition to the basement, each 44 x 204 feet, giving over 60,000 square feet according to the usual floor space occupied. But even this is not sufficient to provide the company with all the room needed, and they have been obliged to build galleries on several floors for the purpose of arranging bins to store their enormous stock of furnacemen's supplies. The visitor to the establishment is surprised to find how carefully every cubic foot of space has been utilized, but in looking over the stock he speedily realizes that it is essential in order to successfully conduct a business which comprises so many details. From basement to top floor the most perfect system obtains. In the basement are stored furnaces

cast iron radiators and other heavy goods. Here also are machines for working on heavy steel plate for the various parts of the Excelsior steel furnace. In the rear is a circular saw, constantly occupied in sawing lumber for crating. This lumber is cut exactly to the inch for making the numerous sizes of crates required. It is then elevated to the shipping floor and each size is separately stored in a labeled bin, so that the packers have no cutting or fitting to do in preparing goods for shipment. The upper floors are devoted to light manufacturing and storage. Special trucks or cars have been devised by which large quantities of goods can be easily shifted from one place to another, or removed to the shipping floor by either of the two elevators with which the building is supplied. The company are large consumers of tin plate, constantly carrying thousands of boxes in stock. They sell tin plate as well as furnace fittings, furnaces, steam and hot water radiators, &c.

An annex of the Chelsea Stove Works, Chelsea, Mich., owned and operated by F. P. Glazier & Co. as a tin shop, was destroyed by fire on Tuesday, together with a large portion of its contents.

Articles of incorporation were recently filed in the office of the Secretary of State at Columbus, Ohio, by the Monroe Stove Company of Mansfield, the capital stock being placed at $25,000.

We quote the following from a letter recently received from a furnace manufacturer: There is no doubt in my mind that more attention in the future will be given to improving and perfecting the hot air system, for the reason that purer air is obtained by it than with steam or hot water heating, unless indirect radiation is resorted to. This, however, is expensive to put in and expensive to run, and it requires a skilled man to handle it to avoid accidents. It is my belief that if first class hot air furnaces of sufficient size were always used instead of small, insufficient, cheap heaters, hot water and steam would be but little employed.

At a recent meeting of the stockholders of the March Brownback Stove Company at Pottstown, Pa., permission was granted the directors to lease or sell the property of the company at 3626 Powelton avenue, Philadelphia. At this meeting officers and directors were elected, the latter consisting of James Brownback, James Rogers, T. J. March, H. M. Ebert, Franklin March, A. K. Shaner, H. G. Kulp and John H. Towers The officers elected for the ensuing year are James Brownback, president; James Rogers, vice-president; T. J. March, treasurer, and H. M. Ebert, secretary.

The Weir Stove Company of Weir Village, Mass., have been making some improvements in connection with their plant, and among other things are putting on a new roof to one of their buildings.

It is stated that the Lebanon Stove Company of Lebanon, Pa., recently took an order from a New York concern for 200 gas stoves. If the goods prove satisfactory it is intimated that a large order will result.

L. B. Jones, successor to the Security Gas & Vapor Stove Company, St. Louis, Mo., reports a large demand for their Independent Barbecue broiler, which can be attached to coal ranges and makes a summer and winter broiler. Janes & Kirtland, New York, who are Eastern agents for the sale of these broilers, are attaching them to their B. B. ranges, and report that they are giving excellent satisfaction.

The Front Rank Steel Furnace Company, St. Louis, are sending out to the trade an illustrated catalogue describing the Mouat hot water heater, for which they are sole agents. This heater is referred to in the catalogue as being the most powerful, economical, durable direct circulator of hot water in the market. The catalogue contains engravings of a number of churches, residences, schoolhouses, &c., which are heated by the Mouat heater. In addition to this the catalogue contains cuts of the heater with sheet iron jacket and heater set in brick work; also side view showing circulation, construction, &c. The catalogue is handsomely printed and will be sent to the trade on application.

Henry Bartholomai, for nearly ten years past foreman of the foundry of the Enterprise Stove Company, Vincennes, Ind., committed suicide on March 16 while temporarily insane. He had complained of feeling unwell for two weeks or more, but no serious thought was given to it for the reason that he continued to perform his duties as usual. On Saturday morning he left home at 6 o'clock to open the foundry, and was found dead a half hour later. He was 45 years old, had always lived a strictly temperate and upright life. He leaves a wife and seven childen, who have the sympathy of the entire community in their sad bereavement.

W. H. Martin, Chicago manager for the Peck-Williamson Heating & Ventilating Company, has removed his office and salesroom temporarily to room 1 at 59 Lake street, Chicago. After May 1 he will be permanently located in another part of the same building but with entrance at 41 State street.

The Sanitary Pressers' Association, composed of the workmen in the sanitary potteries at Trenton, N. J., have decided to accept a new wage scale, which reduces the rates paid a year ago from 33⅓ to nearly 60 per cent. This action is the result of a war begun at the end of last summer between the Trenton Potteries Company and the factories outside the sanitary ware syndicate, as a result of which the selling prices were reduced between 50 and 60 per cent. Wares were, for a time, sold at practically less than the cost of manufacture. The reduction accepted by the Trenton workmen will, it is believed, compel the closing of nearly all the Western sanitary potteries. The new wage schedule comes into effect on Monday, when the men will return to work after a long period of idleness.

Forty potters at the Great Western Pottery, Kokomo, Ind., went on strike on Monday on account of a reduction of 15 per cent. in wages. The company claim that all the Eastern potters have made a cut and that they are compelled to do the same or go out of business. It is expected that the reduction will probably stand.

The lead works of Tatham Bros., 224-226 South Fifth street, Philadelphia, were damaged by fire to the extent of $3000 on March 22.

SCRAP.

J. H. Rogers, managing partner of E. Morewood & Co. and the Swansea Tin Plate Company of Wales, arrived at New York last week from England. Mr. Rogers is now visiting the works of the Morewood Company, at Gas City, Ind.

Work on the new tin plate factory recently located near Frankton, Ind., will, it is announced, be begun at once. The plant will probably be ready for operation about October 1.

N. & G. Taylor Company, Philadelphia, contemplate erecting an addition to their works during the coming spring for the production of continuous roofing terne. The company began the manufacture of this material during the past year and are now turning it out with great success. They are also arranging for the production of large tinned sheets, which they expect to able to place on the market at a lower price than that now asked for this material by foreign manufacturers.

The American Tin Plate Company, Elwood, Ind., find plenty of work for the recent addition to their plant. Their mills are reported as running to full capacity, turning out about 6000 boxes of finished plate every week.

On Tuesday, March 19, in the presence of a large number of townsfolk, the new plant of the Montpelier Steel & Tin Plate Company of Montpelier, Ind., was opened, to the strains of music from a band composed of workers in the mill. The first sheet was rolled by Harry Herbert, the superintendent, from fine open hearth steel, the operation being a complete success. The mill is now running regularly night and day and turning out some 30 tons of black plates of excellent quality daily. The equipment of the works consists of 6 Totten & Hogg hot and 6 cold mills and 12 tinning sets. Two of the mills are not yet completed, but will be in operation shortly. Several grades of tin and terne plates will be produced. The works will employ over 200 hands. The office of the Montpelier Steel & Tin Plate Company is in the Board of Trade Building, Columbus, Ohio.

We are indebted to Bruce & Cook, 190 Water street, New York, for a copy of the second edition of the valuable table of net weights of tin plates, distributed by the firm with their annual calendar, and which was reproduced in *The Metal Worker* of January 12. To the original table has been added in this edition the net weights of wire gauge D plates, and also taggers iron and tin.

The construction of the tin plate mill of the Laughlin Nail Company at Martin's Ferry, Ohio, is progressing satisfactorily, and the works will, it is expected, be in operation by June 1. The plant will consist of four hot mills and three cold mills, with accompanying tinning sets. The output of the concern will include charcoal and coke bright plates, as well as roofing ternes.

The plant of the Crescent Sheet & Tin Plate Company, at Bessemer avenue, Cleveland, Ohio, will be completed and ready to run about May 1. Buildings and power are provided for six hot mills and ten tinning stacks. The start will be made with four hot mills, two others and the tinning department to be added in the course of the summer.

THE TIN PLATE DEPARTMENT of the Old Dominion Iron & Nail Works Company, Richmond, Va., is now in active operation, turning out a full line of bright and roofing plates. The company contemplate building a four mill black plate plant in the near future.

THE ÆTNA-STANDARD IRON & STEEL COMPANY of Bridgeport, Ohio, expect to have their full complement of eight tin mills in operation by April 1. A large addition which they are making to their tin house equipment will be ready by the middle of that month, by which time the works will possess a materially increased capacity for production.

PREPARATIONS are now being made by the Atlanta Steel & Tin Plate Company, Atlanta, Ind., for an addition of 175 x 80 feet to their main building, in which will be placed three additional tin mills and a bar mill, making their works a six-mill plant.

THE report is given out that Sydney W. Bypass and Robert Sirvin, two English capitalists, have been visiting Sharon, Pa., with the object of locating there or elsewhere in that section a large tin plate works, to be erected in the near future

THE MILLS of the Somerton Tin Plate Works, Brooklyn, N. Y., have been running full, on three shifts, since November last.

THE PLANT of the Beaver Tin Plate Company, Lisbon, Ohio, is fast nearing completion, and is expected to be put in operation by April 10. The company have four tin mills and eight tinning sets. They propose producing both charcoal, coke and terne plates.

THE TIN PLATE PLANT of Marshall Bros. & Co., Philadelphia, is running full, turning out their well-known brand of Penn Treaty, charcoal, coke and terne plates, for which they find an increasing sale. An additional tin mill is in course of erection, which will make a total of five in all.

THE TINNING DEPARTMENT of the American Stamping Company, Brooklyn, N. Y., has been shut down indefinitely.

THE BALTIMORE IRON, STEEL & TIN PLATE COMPANY, Locust Point, Baltimore, Md., advise us that their mill, which has been closed down since October 6, will start up on April 1 after considerable enlargement and improvement.

THE WORKS of the Ellwood Tin Plate Company, Ellwood City, Pa., are now in full operation with four tin mills and eight tinning sets. The company are producing a line of four grades of bright charcoal plates, a brand of coke tin and five brands of roofing plates.

AFTER SEVERAL MONTHS of labor troubles the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., have their works now running to full capacity. They advise us that they are now in a position to regularly supply the trade with their well known brands of bright and terne plates.

THE MORTON TIN PLATE COMPANY, Cambridge, Ohio, have had their three black plate mills in regular operation since January 1, with every success. They have now started their dipping works and have commenced the production of tin and terne plates.

GUMMEY, SPERING & CO., Philadelphia, report an improvement in the demand for their brands of tin and terne plates. Their Pennsyl Old Method roofing plates, they state, are in particularly active demand. These plates they guarantee to contain 45 pounds of coating to every box of 112 sheets, 20 x 28, which it is claimed is all any plate will hold. Their Alderley roofing plate is increasing in popularity, and the reports concerning their Gummey Anti-Pinhole bright tin plates are most satisfactory. These plates, the firm state, are made in the old-fashioned way from Swedish bars hammered out, and the process of manufacture is so slow that four boxes only per day are turned out. They are largely used for making tinware required to stand long service, such as hotel ware. Phœnix is the name of an imported brand of bright plates sold by the firm, and it is claimed that they are the heaviest coated of any coming to this market. The firm have a good stock of plates of all kinds on hand at their store, there being upward of 1000 tons in sight on their main floor. There is also a stock of about 200 tons of galvanized iron on the same floor.

THE HENDERSON TIN PLATE COMPANY'S tinning plant at Norristown, Pa., has been sold out to a new concern, who have commenced business under the name or style of the Filley Tin Plate Company. The new concern enter the market with seven brands of terne plates and four brands of brights. The terne brands are Filley Old Style, Filley Roofing, Fidelity, Champion, Union, Victory and Admiral. The brands of charcoal brights are Radiant and Adonis, and of the coke brights Hero and Ella.

THE OHIO RIVER SHEET & TIN PLATE COMPANY, composed principally of former employees of the United States Iron & Tin Plate Mfg. Company at Demmler, Pa., have been organized, and will erect a tin plate plant at Remington Station, on the Pittsburgh, Fort Wayne & Chicago Railroad, near Rochester, Pa. It will be a two-mill plant, and the contract for the erection of one stand of roughing rolls, two 24 x 32 inch hot mills and two 22 x 34 inch cold mills has been placed with the Leechburg Foundry & Machine Company, Pittsburgh, Pa. Alexander Saulters is president of the new concern. The Leechburg Foundry & Machine Company shipped last week four cold mills to the La Belle Iron Works, Wheeling, W. Va., one Mesta patent pickling machine to the Pennsylvania Tin Plate Company, New Kensington, Pa., and another to the Crescent Sheet & Tin Plate Company, Cleveland, Ohio.

JOHN S. TREGONING of J. S Tregoning & Son, owners of one of the largest tin plate works in South Wales, announced lately that their plant at Morfa was shut down indefinitely, and would not run again until the condition of things in South Wales was much improved. Messrs. Tregoning's works have been running continuously for more than a generation, and the majority of their work people have grown up in them, some having been in the service of the firm for over 40 years. This action, which has been forced on the firm by the present condition of business, means absolute ruin to many of these people, who are fit for nothing outside the tin plate trade. This is only one of many similar cases in the Welsh tin plate districts, where the distress among this class of labor is very keen and the prospect of relief exceedingly remote.

RECORD MFG. COMPANY, Conneaut, Ohio, are able to report extreme activity in their tin plate manufacturing department. The company are turning out bright charcoal and coke plates.

A REPORT from Elizabeth, N. J., states that a company, to be known as the Elizabethport Tin Plate Company, have been organized at that place, with a capital of $150,000, to manufacture tin plate in the plant formerly owned by the Morewood Tin Plate Company, on Staten Island Sound. The property, which covers three acres of ground, has, it is said, been bought from the Morewoods by the new concern, who will increase the capacity of the works. H. Pritchard is named as general manager, and the date given for the beginning of operations is June 1.

THE FRANK KNEELAND MACHINE COMPANY, Pittsburgh, Pa., have completed and shipped all the mills and shearing machinery for the Pennsylvania Tin Plate Company, New Kensington, Pa., and the Crescent Sheet and Tin Plate Company, Cleveland, Ohio, both being four-mill plants. They have also recently shipped the shearing and tinning machinery for the new plant of the National Tin Plate Company, Anderson, Ind.

TRADE REPORT.

The Iron Market.

The official announcement that the price of Connellsville furnace Coke is to be $1.35 per ton at oven has removed a fruitful topic for guessing. The figure is higher than was generally believed probable and represents an advance of 45 to 50 cents. It is justified on the plea that the advance in wages demands it and that the Coke operators are tired of exhausting their property for the privilege of furnishing their customers material at cost or below it.

The advance will meet with much resistance, since there is a chance that it may not be firmly maintained. Furnacemen will draw upon accumulated stocks until they are exhausted, so that the Coke trade is expected to be pretty dull early in April.

In line with the recent purchases of Pig by a leading Pittsburgh concern is the buying of 10,000 to 15,000 tons of Old Material by the same interest. It is reported that a similar buying movement has taken place in the Mahoning Valley.

Cincinnati reports sales of 20,000 to 25,000 tons of Pig Iron, thus showing a continuance in the activity in that market. In other sections the movement is moderate. The advance in Coke ought to give the Southern furnaces an advantage of about 50¢ a ton over their Northern rivals, whose cost of production will be increased.

Pig Iron.—Reports from New England indicate that there is a somewhat better movement there. In the New York market business is dull and competition is very keen. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

A very considerable improvement in the demand for Pig Iron is reported from Philadelphia, and in Bessemer an advance of about 25¢ ℔ ton. In non-Bessemers, however, prices are unchanged, although there is less Iron for sale at the inside figures, and in some instances sellers ask a trifling advance, but nearly all the sales were at last week's prices. Some large lots were taken, the volume of business averaging larger than for many months past, the idea among consumers being that if prices do not advance they will certainly not decline. There is a full supply, neverthcless, and holders have not been slow in meeting the demand when the right kind of bids were made. Asking prices are slightly higher and in most cases about as follows for Philadelphia delivery and 20¢ @ 25c less for points within a radius of 100 miles South or West:

Standard No. 1 Foundry X	$12.00 to	$12.50
Standard No. 2 Foundry X	11.25 to	11.50
No. 2 Plain	10.75 to	11.00
No. 1 Soft	11.50 to	11.75
No. 2 Soft	10.75 to	11.00

According to advices from Chicago, trade in local Coke Iron was hardly as active the past week as it has been, but the volume is still excellent and better inquiries are now in hand. The firmness of the local makers is somewhat resented by large consumers who are approaching the time for renewing contracts, and they are endeavoring to make a break in the line. It is likely that some of these purchases may be deferred in the hope of tiring the manufacturers. Business generally, however, is large enough to make the latter feel quite sure of their ground. They are, therefore, slightly advancing prices instead of marking them down. Business in Southern Coke Iron has been only of moderate dimensions. The attitude of Southern furnacemen is fairly firm, but occasionally a concession is given to secure some specially desirable order. Lake Superior Charcoal has been extremely quiet. Quotations are as follows for cash:

Lake Superior Charcoal	$12.75 to	$13.00
Local Coke Foundry, No. 1	10.25 to	10.50
Local Coke Foundry, No. 2	10.00 to	10.25
Local Coke Foundry, No. 3	9.50 to	9.75
Local Scotch No. 1	10.25 to	10.50
Ohio Strong Softeners, No. 1	12.50 to	13.00
Southern Silvery, No. 1	11.50 to	11.75
Southern Silvery, No. 2	11.25 to	11.50
Southern Coke, No. 2	10.00 to	10.25
Southern Coke, No. 3	9.50 to	9.75
Southern, No. 1, Soft	10.00 to	10.25
Southern, No. 2, Soft	9.75 to	10.00
Alabama Car Wheel	17.50 to	18.00
Jackson County Silvery	15.00 to	15.25
Other Ohio Silvery	14.25 to	14.50

Sales during the week in the Pittsburgh market have been exceedingly light. The demand for Foundry Irons does not improve and prices are as low as ever. Recent sales of Foundry Iron have been made at prices as low, or lower, as have yet been made. Under existing conditions it is somewhat difficult to quote the market, but for April and May delivery it is fairly represented by the following quotations:

No. 1 Foundry	$10.25 to	$10.50, cash
No. 2 Foundry	9.50 to	9.75 "

Further large sales of Pig Iron have been made in the Cincinnati market during the past week, and at the moment further transactions of importance and magnitude are pending. The aggregate transactions range between 20,000 and 25,000 tons, a prominent feature being the number of small orders placed. The Iron sold covers all sorts and kinds, both Coke and Charcoal, Northern and Southern brands, Mill and Foundry grades. If there is any predominance it is in favor of Mill Iron, one lot of 5000 tons being reported. Most of the transactions cover four to six months in delivery and one lot of 1000 tons Foundry Iron was sold to a local consumer for delivery during the entire year. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to	$10.00
Southern Coke, No. 2	9.00 to	9.25
Southern Coke, No. 3	8.50 to	8.75
Ohio Soft Stone Coal, No. 1	14.50 to	15.00
Ohio Soft Stone Coal, No. 2	14.00 to	14.50
Lake Superior Coke No 1	11.75 to	12.25
Lake Superior Coke, No. 2	10.75 to	11.50
Hanging Rock Charcoal, No. 1	16.00 to	16.50
Hanging Rock Charcoal No. 2	15.50 to	16.00
Tennessee Charcoal, No. 1	13.00 to	13.50
Tennessee Charcoal, No. 2	12.00 to	12.50
Bessemer	11.65 to	12.00
Standard Southern Car Wheel	15.75 to	16.75
Lake Superior Car Wheel and Malleable	14.25 to	14.75

The demand for Pig Iron in the St. Louis market does not show any material change from the several preceding weeks. Orders are limited in size but are more numerous. The local consumption shows a steady increase and shipments are being received without any requests to hold them back. Prices are unchanged and No. 2 Foundry is quoted at $6.50, f.o.b. cars Birmingham. It is difficult to induce consumers to anticipate their wants more than 30 days ahead, so that the volume of business is necessarily limited. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.00 to	$10.25
Southern Coke, No. 2 Foundry	9.25 to	9.50
Southern Coke, No. 3 Foundry	9.00 to	9.25
Southern Car Wheel	16.00 to	16.50

Metal Market.

Pig Tin.—Speculation has been exceedingly cautious, narrow at that, but mainly "bullish" in a sentimental way. That is to say, some operators have made the most of conditions calculated to raise prices, and, meeting little resistance, accomplished something without adding much to their holdings. In other words, wholesale prices were carried up to the basis of 14¢ net cash for prompt and current month delivery, while the discount on futures has been narrowed as well. The purchases for out of town jobbing account and by consumers have increased somewhat, and indicate that deliveries, although somewhat extensive of late, have been well taken care of, leaving the market in quite good form, as far as position of stocks here is concerned. The market closed very firm with prices at the highest point of the week. Quotations on small lots of Straits from store are virtually unchanged at 14½¢ @ 15¢ ℔ lb.

Copper.—Current report has it that considerable Copper has recently been sold for export. At headquarters the usual lack of knowledge of anything of the sort was displayed. The outside statements place the volume of business at about 2000 tons, but are extremely vague as to price and delivery. It would appear, however, that negotiation with home trade buyers has moderated somewhat and that offers at recent extremely low prices are not duplicated. To this extent the market has improved, but the turn is almost wholly on stock for immediate delivery. Forward deliveries are the subject of negotiation at prices upon which buyers and sellers appear to be considerably apart. In retail business inquiry has been moderate. Prices for small jobbing quantities are unchanged on a basis of 10½¢ for Lake Ingot.

Sheet Copper.—No material improvement is noticeable in the demand for Cornice Copper, which still keeps below the average of the season. Rather better inquiry is, however, regarded as indicating a larger business later in the spring, when building work now beginning or in contemplation gets well under way. The outlook is looked on as being decidedly more promising for this class of goods than has been the

case for a year or two past. Small lots of Sheet Copper from store are quoted at the net list price of 14¢ ℔ lb

Pig Lead.—Business has been less active in this market the past week. Dealings and negotiation served to carry prices higher, however, and stimulative advices from the West gave additional tone. The price for small lots of American Pig from store rules at the same level that it has held for some weeks past, namely, 3⅜¢ @ 3½¢ ℔ lb.

Spelter.—Outside of ordinary carload business there has been little doing here, but orders from other quarters have gone out more or less freely and the trade resulting therefrom has served to give the market quite good tone. Prices for small jobbing parcels of good Western brands are quoted at 3¾¢ @ 4¢ ℔ lb.

Sheet Zinc.—There is little change in the market for this material. Demand from consumers is commonplace in the extreme, and prices exhibit no change from the figures quoted from week to week for some time past, namely, 4½¢ @ 4¾¢ ℔ lb for 600-lb casks and 5¢ @ 5¼¢ for smaller lots.

Antimony.—Business has been rather slow and the market is weakish under the influence of lively competition. Prices for small parcels are quoted at 9¼¢ @ 9½¢ for Cookson's and 8¢ for Hallett's.

Nickel.—Seller's quotations remain at 35¢ @ 40¢, according to quantity.

Tin Plate.—The market does not show quite as good form as it did a week ago. Large business, particularly in orders for future deliveries, has fallen off somewhat, and spot stock in quantities is only in fair demand. Small business, however, keeps up pretty well, and, in the aggregate, has not made a bad showing. Milder weather has stimulated the demand for Roofing Plates to some extent in this section. Prices have suffered no radical change, but the market is weaker to this extent, that it is easier to buy at figures that sellers mentioned very recently as being too low.

A special London cable dispatch of March 27 to *The Iron Age* reports on the British Tin Plate market as follows: Tin Plate has been in good demand and buyers have manifested eagerness to place contracts at last week's prices. Makers are reluctant to book forward orders owing to uncertainty of the wages question. Asking prices average about 2 pence dearer. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20	9/3	@ ....
Siemens Cokes, IC 14 x 20	9/6	@ ....
Ternes, 20 x 28	17/6	@ 22/6
Charcoals, IC 14 x 20	10/	@ 13/

Sheet Iron.—The demand for both Black and Galvanized Sheets continues active, and the fact that buyers are insisting on early shipments indicates that stocks are light. Several of the mills have contracted for their output up to July 1, but others are firmer as to their prices for forward deliveries. Small lots of No. 27 Common Iron are quoted at 2 60¢ @ 2.65¢ from stock and of Galvanized at 75 and 10 % off.

JACOB BROMBACHER'S SONS, 30 Cliff street, New York, manufacturers of Tinners' Tools and Machines, have moved their office in this city to their Brooklyn factory, 31 Fulton street, near Fulton ferry. Hereafter shipments will be made direct from the warehouse in Brooklyn, where a complete stock will be carried. The sample room is still maintained at 30 Cliff street.

Chicago Report.

Scrap.—Only a moderate trade is in progress. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$6.50	....
Machinery Cast	5.50	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	7.50	....
Copper Bottoms	....	6 ¢
Copper Clips and Heavy	....	7 ¢

Trade Notes.

WILLIAM CONNERS, Troy, N. Y., has secured a large order for American Seal Paint, with which the Hotel Champlain at Bluff Point, N. Y., is to be painted, the work to be done by Callanan & Prescott, Keese Valley, N. Y.

THE RECEIVERS of the McCullough Iron Company of Chester, Pa., have petitioned the court to be allowed to borrow $32,000 with which to erect a galvanizing works.

WE HAVE RECEIVED from the Prince Mfg. Company, 71 Maiden lane, New York, a pamphlet entitled "The Rusting of Iron and Steel: How it may be Prevented and How it is Promoted." This pamphlet describes and mentions the principal characteristics of Prince Brothers' Mineral Brown, formerly called Prince's Metallic Paint. This Paint is made of iron ore which is carefully roasted to change it into peroxide of iron, which is then ground to an impalpable powder and finally mixed with pure linseed oil. It is stated that this paint is particularly applicable to iron and steel surfaces which it is designed to prevent from rusting; that it covers well, adheres with the greatest firmness and altogether forms a very perfect and durable covering.

CONDITION OF THE

Hardware Trade.

THE INDICATIONS OF IMPROVEMENT in the general business situation, which are quite marked in some directions, are regarded by many as the precursors of a general revival of trade and a return to a normal demand. Those who take a comprehensive view of the market are therefore watching it closely with a view of determining the probable course of things and deciding upon the policy which should be pursued, so as to take prompt advantage of any favorable turn. It seems hardly likely that the downward course of prices of raw material and staple goods can be continued much longer, and there are some indications of a strengthening in tone. In the Hardware market there is little new to report. Prices are not materially changed except in the matter of Tacks. There is a perceptible improvement in the demand in many sections, and the South and West are certainly doing a fair, and in some cases a good, business. The Eastern and Middle States apparently are not quite so active, the trade being still very conservative in their purchases. Business is also somewhat spasmodic and uneven. Seasonable goods have a prominent place in nearly all orders. Some manufacturers report business nearly up to normal volume when it is estimated by the quantity of goods handled, but the low prices now current keep down the aggregate in dollars and cents.

Advices from Chicago. — Heavier business is reported by Shelf Hardware jobbers. The packing floors of the local houses now look very much like old times. A few concerns have recently been obliged to employ their packing force at night. The demand covers all kinds of merchandise. The country trade is evidently forcing merchants to buy much more liberally, as orders are almost invariably specified for prompt shipment, showing that goods ordered are immediately needed by consumers. Tinware is in very good demand. Tin Plates are moving more freely, and Roofing Plates have again taken their proper place in shipments from local jobbing houses. Staple goods are moving only moderately and are not contributing their usual bulk to the volume of the business. The Heavy Hardware trade is much better than at any previous time this spring. Wagon makers, blacksmiths and machine shops are purchasing quite freely, and in some cases stocks are being ordered by consumers who think this a good time to make a little preparation for the future.

Notes on Prices.

Wire Nails.—There is a good deal of inquiry and a pretty free movement of Nails, but the market shows the effect of the recent large purchases, many jobbing houses being apparently supplied sufficiently to cover their present requirements It is expected that with the advance of the season business will increase in volume and that a large trade will be done. The market in the matter of prices is in substantially the same condition as a week ago. Most of the manufacturers are maintaining prices quite firmly and the market has a good tone.

Advices from Chicago.—A very good carload trade is reported by manufact-

urers, with some indication of stocking up among the jobbers, outside of this immediate locality. Orders which are so received are in every case for immediate shipment. The manufacturers hope that this is the forerunner of the usual spring rush, which has now been delayed some three or four weeks owing to the steadiness of the cold weather. Jobbers' prices show no change, but stand at $1 to $1.05 for small lots from stock, with a few houses still quoting 95 cents for carload lots. The end of these low prices, however, is very rapidly approaching.

Cut Nails.—Trade has not been especially active during the past week, but the mills report a good many inquiries and refer to the indications for the opening season as being on the whole encouraging. Small lots from store at New York are quoted at 85 to 90 cents.

Advices from Chicago.—Manufacturers have recently enjoyed an excellent trade in carload lots, but have as yet seen no disposition among their customers to lay in stocks. Small lots from stock stand at $1.

Barb Wire.—Manufacturers continue to take a hopeful view of the outlook and report inquiries and orders good for the season, considering the prevailing conditions. Prices are about as they have been for the past week or two. The disposition of some of the jobbing houses to shade manufacturers' quotations is having some effect on the market.

Advices from Chicago.—The large business noted last week has maintained its volume, but it did not develop into the great activity expected. This was probably due to less favorable weather for a few days, which, however, has again changed for the better. Business now in progress is well up to the capacity of the mills, but at this time of the year manufacturers are accustomed to being rushed. It is expected that within the coming month a heavier trade will surely be felt. Small lots from stock are quoted in a regular way at $1.65 and $2. Some of the jobbers, however, continue to cut manufacturers' prices 5 cents per 100 pounds, but they say the situation is such that these extreme prices are likely to be withdrawn any day.

Tacks.—Revised list prices on Tacks, to which reference was made in our last issue, have been announced by the Atlas Tack Corporation and other leading manufacturers. In the new list prices are revised throughout and inequalities in the old list corrected. With the exception of a few unimportant corrections made in 1889, there has been, we believe, no revision of the Hardware Tack price-list since 1882. Since that date numerous new styles of packing have come into vogue, and as a consequence numerous price-lists to correspond. One object of the manufacturers in adopting this new list, which will be known as the list of March 25, 1895, is to consolidate these lists in one, with the correction of inequalities, so as to make it represent the present costs of the goods. Under the former list the smaller sizes were relatively too low and the new list prices are accordingly increased. From the discount sheet which is given below it will be seen that the list is relatively a high one, the manufacturers having adopted this policy in accordance with the request of the various jobbers' associations for high lists and long discounts. The new list has been adopted by nearly all the manufacturers in the country, and it is hoped that it will be found to give satisfaction to all interests and remain for a long time without change. The few manufacturers who did not participate in the preparation of the list will undoubtedly adopt it, so that it will be uniformly used. The discounts applying to the new list are as follows, with an additional 33⅓ per cent. and 2 per cent. for cash, with the usual deliveries:

	Discount. Per cent.

Freight will be prepaid or the actual cost of delivery will be allowed on goods in quantities of 300 pounds or more to Boston, New York, Philadelphia, Baltimore, and to the principal points on or east of the Missouri River.

Milk Can.—The Porcelain Lined Milk Delivery Can put on the market by Stuart & Peterson Company, Burlington, N. J., and illustrated in our last issue, is sold at 50 cents for the 1-quart size and 70 cents for the 2-quart size, subject to a discount to the trade of 50 per cent.

Roaster or Oven.—Leach Roaster & Baker Company, Paxton, Ill., are manufacturing the Champion Roaster or Oven which was illustrated in *The Metal Worker* of the 23d inst. This article is sold from the following list, which is subject to a discount of 33⅓ per cent. to the trade:

No.	
1	$1.50
2	2.20
3	2.65

Glass.—The sub-committee appointed by the Window Glass manufacturers to inquire into the cost of imported Glass in the East has verified the statement which has been made that domestic Glass has been sold below the price of the imported article. The difference in price is stated to average about 15 per cent., and has had the effect, it is believed, of keeping something like 1,000,000 additional boxes of foreign Glass out of the market. While the low price of American Glass has kept so large a quantity of foreign Glass out of the country, it has done so at the expense of the home manufacturers, which in some cases has been so sorely felt that better prices are deemed a necessity. It is considered probable that when prices take an upward turn the price of imported Glass will be the basis governing the selling price of American Glass. It is not improbable that the cost of American Glass, at least of some sizes, will be increased by the demands of the workers or by concessions in wages on the part of manufacturers, or by both, before the factories start in the fall. The outlook indicates no scarcity of Glass for the spring and summer trade, as it is estimated that there are from 1,200,000 to 1,800,000 boxes of Glass in the hands of the manufacturers, buyers and large consumers. There is no change in the condition of trade, the demand being limited and for immediate consumption only, while prices are in an unsettled condition.

Old Metals.—The demand continues fair, but the supply of most kinds of Old Metals is amply sufficient to prevent any radical change in prices. In Iron there is a good demand for Cast and Scrap. Quotations in a general way are unchanged, the following representing dealers' purchasing rates for moderate lots, New York delivery:

Heavy Copper	₩ lb 7 ¢
Light and Tinned Copper	₩ lb 6½¢
Heavy Brass	₩ lb 4¾¢
Light Brass	₩ lb 3¾¢

It Is Reported—

Alabama.

That Harwell & Armistead is the name of a new Hardware concern at Montgomery.

Arkansas.

That Daniel Abney has opened a new Hardware store at DABNEY.

That W. A. Tymich has opened a Hardware and Implement store at HAZEN.

That Moss & Martin have succeeded J. W. Moss in the Hardware business at DYER.

California.

That E. S. Fowler, Hardware, MIDDLETOWN, has sold out to F. W. Henderson.

Connecticut.

That Charey & Latham, in the Hardware business at NEW LONDON, have been succeeded by Daniel Latham.

Florida.

That Mr. Watts of DE LAND, formerly of LEESBURG, will soon remove to BRAIDENTOWN, where he will engage in the Hardware business.

Illinois.

That Jones & Allen are successors to Ruddy Bros. at PONTIAC.

That Harry Evans has bought a half interest in the Hardware store of Galloway & Son, WELLINGTON. Hereafter the firm will be Galloway & Evans, Mr. Galloway, senior, retiring from the business.

That N. G. Clark and William Cronable have bought out the Hardware store of G. G. Shearer at MAQUON.

That Miller & Stephenson's Hardware store at NEPONSET was burglarized a short time since and $200 worth of goods carried away.

That W. A. Melody's Hardware store at WAUKEGAN was robbed of $200 worth of goods on the 10th inst.

Indiana.

That J. Patterson & Co, Hardware, &c., PETERSBURG, have been succeeded by Petersburg Implement Company.

That the Hardware store of Griffin Bros., NOBLESVILLE, was entered by burglars on the 17th inst., and a large amount of Cutlery and fine Revolvers stolen.

That the Fuller Hardware Company of CRESTON have been incorporated, with a capital stock of $50,000. The incorporators are M. E. Fuller, A. R. Fuller and A. Roy Fuller.

That G. E. Wetmore of VILLISCA has bought a Hardware store at MOUND CITY, Mo.

That the Marsh Cure Hardware Company have succeeded J. W. Stebbings at SPENCER.

That M. J. Lahiff has purchased the Hardware store of J. T. Hood at CLARE.

That Fletcher Emory of NORTHWOOD has bought Garner Bros.' Hardware store at MASON CITY.

Kentucky.

That Ebelhar & Co. have embarked in the Hardware business at OWENSBORO.

That W. R. Ladd & Co. of MIDDLESBOROUGH are closing out their Hardware business.

Maine.

That I. G. Vannah & Co., GARDINER, in addition to other improvements which they have been making, will remove the shelves on the west side of the store and replace them by a set of drawers extending the length of the store and from the floor to the ceiling. There will be nearly a thousand of them in all. They will be made of white wood and pine.

That George Houghton will shortly open a new Hardware store at MARS HILL.

Massachusetts.

That Matthew R. and Frank E. Loud have opened a Hardware store at SOUTH WEYMOUTH.

Michigan.

That Charles S. Blom, Hardware, KALKASKA, has been succeeded by H. L. Pipp & Co.

That E. E. Kohler, formerly in the employ of the Pontiac Hardware Company, and C. B. Pittman & Co., PONTIAC, has purchased a stock of Hardware at BYRON and will open a store there.

That Frank B. Kelley has become a member of the Newark & Drury Company of CADILLAC.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

— No Such Fiend.—"Can I write my name under the received payment on this bill?" asked the collector, who likes to put things as delicately as possible.

"No, thank you," replied Mr. Brokely. "I'm no autograph fiend."—*Washington Star.*

— "Whut yoh dun whup de boy foh?" asked Uncle Eben as he came into the cabin with a sable youngster whimpering at his side.

"I whup 'im 'cos he done stole er mushmillion f'om de freight train," replied Aunt Chloe, with a glance of indignation.

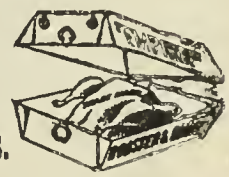
"He done stole a mushmillion!"

"Dat's whut he done. It's scan'lous ter t'ink ob dat boy whut we raise so keerful stealin' mushmillions! An'," she added, with increased feeling, "dah wus watshmillions in de nex' kyah!"—*Washington Item.*

ROYAL
WASH BOILER HANDLE.

PATENTED.

We call the trade's special attention to the Royal Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.



The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

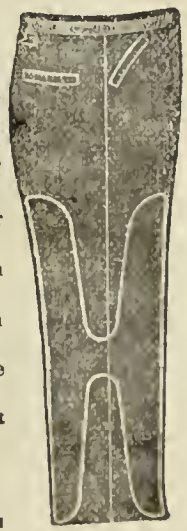
Covert Pants Stretcher.

Before. After.

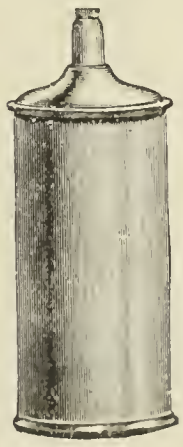
THE Covert "Pants Stretcher" will restore the pantaloons to their original shape and length.

It removes all **WRINKLES and BAGGING AT THE KNEES,** giving them the appearance of having just left the tailor's hands.

It also holds the pants in a convenient position for brushing and cleaning.



The Stretcher cannot get out of order, and can be adjusted in the pants in a few seconds.



It being applied inside the pants, it obviates all objections prominent in other stretchers.

It is made of steel wire, and being in sections can be packed in a valise when traveling. Sold by the trade, or

Sample pair sent by mail to any address, free of postage, on receipt of $1.00.

MANUFACTURED ONLY BY
COVERT MFG CO., WestTroy, N. Y.

This little Torch is 4 in. high and 1¼ in diam. and is designed to do away with the greasy candle. Will burn gasoline or kerosene oil.

Sold by All Jobbers.

WEST'S DUST PAN,

Patent applied for.

the daintiest, handsomest, cleanest, cheapest and most convenient Dust Pan in the world.

You see, I don't have to get on my knees or break my back or split my dress, etc., stooping, or smother myself with dust when using this Dust Pan.

I just place my foot on the tread, thus, while I sweep the dust into the pan and carry it away like this, so the dust can't spill out.

I guess it will last my lifetime although it costs only ten cents.

For sale by all jobbers.

SECOND EDITION.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

WITH THIRTY-FIVE ILLUSTRATIONS.

48 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

AN IMPORTANT FIXTURE.

A new Water Closet for Hospitals, School Houses and Public or Private Buildings.

THE

Puritan Wash-Down Water Closet.

PATENTED.

WHY THE PURITAN WASH-DOWN IS BETTER THAN ANY OTHER FORM OF CLOSET.

It is simple and compact. The Tank being counected directly to the closet does away with unsightly pipes on the wall and reduces the noise to a minimum, and at the same time being more effective and has a larger surface of water. The joint where the earthenware connects with the soil pipe is under water, which is an absolute safeguard against the leaking of sewer gas. It is especially adapted for fire-proof buildings, and the soil pipe can run on the floor either in front or behind the partition. There is no chance for stoppages and there are no concealed spaces, all parts being accessible.

The body of the closet is made of vitreous or non-absorbing ware and is perfectly sanitary.

GOOD FIXTURES ARE CHEAP, AND POOR FIXTURES ARE EXPENSIVE.

Each Closet is guaranteed for a term of years. Call and see the operation of the Closet at our **SHOW ROOM.**

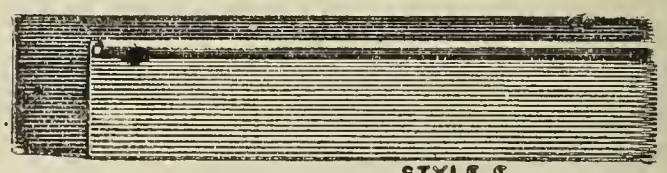
The Climax Ratchet Stock

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00



For sale by leading jobbers.

122 and 124 Second Ave., Pittsburgh, Pa.

CHAMPION of the WORLD.

(No reference to Mr. Corbett.)

In our "PENNSYL" OLD METHOD Terne Plate we have the Champion of all Champions *Roofing Plate*, a fact which is fully borne out by **Architects, Roofers and Builders.**

When we first introduced the "Pennsyl" it was with the intention that it should *always* be the Best and Leading Brand of Roofing Tin made, and it certainly is.

Just to think, every box contains *45 lbs.* of Pure coating. Other brands that are put in competition only have 30 to 36 lbs.

Every sheet guaranteed perfect in every way.

Every sheet stamped and squared.

We put it on the market in 1879 and we have been selling it continually since.

GUMMEY, SPERING & CO.,

Manufacturers and Importers Tin Plate, Metals, &c.

PHILADELPHIA, U. S. A.

Beware of a Brand on the market *simply called* "Old Method," it is a poor imitation, and intended only *to deceive.*

Hicks' Guide
FOR
Builders,
Comprising an easy, practical system of Estimating Materials and Labor for Carpenters, Contractors and Builders.

A comprehensive guide to those engaged in the various branches of the building trades.

By I. P. HICKS.

160 Pages. - 114 Illustrations.

Bound in Cloth, Price, - $1.00

This book presents to the trade, first, an easy, practical system of estimating materials, in concise form for reference. In the next place is given the average day's work of all kinds, and the average rates on which to figure in almost every detail of building construction.

Material and Labor, including Lumber, Carpentry Work Masonry, Plastering, Hardware, Painting, etc., are among the principal divisions. These in turn are illustrated and ably treated under numerous sub-divisions, showing step by step the entire work of estimating, contracting and building, together with the best and most practical methods of doing the work.

This is followed by a section given to the Geometrical Measurements of Roof Surfaces, with numerous illustrations and examples. It embraces a new and simple system of framing curved roofs, also the simplest methods of roof framing of every description, with practical examples thoroughly illustrating nearly every conceivable form of roof and showing many points never before presented.

The volume also contains a chapter on Mitering Planceers, Moldings, etc., illustrating and describing how to make, in an easy, practical manner, many joints which are the source of no little trouble and annoyance on the part of the workman.

Paint Free.

We want every tinner and user of Metallic Paint to test our No. 40 Bright Oxide, and on request will send one free of charge. It does not contain any petroleum, fish or other inferior oil, but is ground in strictly pure Linseed Oil and nothing else. Is entirely free from grit; does not cut brushes, or settle in cans when mixed ready for use; has brilliant color and great covering power. For tinners' use it is undoubtedly the best and most satisfactory paint made; is really no higher in price than the ordinary paints, as its superior spreading qualities and no loss from sediment or grit make up the difference.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstration is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

PRICE, POST OR EXPRESS PAID, $5.

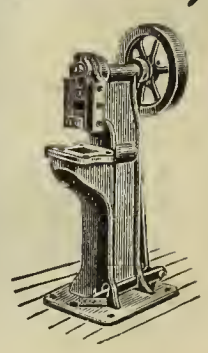
POUCOCK'S ECCENTRIC

FORMING MACHINE.

We invite your attention to this new Former for Tinners' and Sheet-Metal Workers' Rolls, on which we claim rapidity of operation, superior construction and durability. The back roll is moved by eccentrics instead of screws, and can be changed instantly from the small est circle to the passing of a straight sheet. It will flare metal easier and better than any other machine in use. You can get closer to front roll, therefore bend a smaller circle. For sale by all leading jobbers. Send for circular to O. POUCOCK, Mfr. 363, 365, 367 Clark St. CINCINNATI, OHIO. 3-inch Rolls with Slip Rolls a specialty



The Toledo Machine & Tool Co.,

MANUFACTURERS OF

Power Punching Presses, Drop Presses, Trimming Presses, Stamping Presses, Riveting Presses, Embossing Presses, Presses with Automatic Feeds, Chain Presses and Machines for working Bar and Sheet Metals. Complete outfits for Can Making.

Send for Catalogue now being Printed.

THE KEENE FOOT POWER

CORNICE BRAKE.

EASIEST TO OPERATE, STRONGEST AND BEST.

Sheet Metal Working Machinery of all Kinds.

GEO. C. KEENE & CO.,

Cincinnati, Ohio.

PRESSES, DIES AND TOOLS

For Can and Tinware Manufacturers.

Dies for Cutting, Drawing & Stamping Tinware

Estimates given at sight of samples of drawing work.

Send Sample for Prices before ordering elsewhere.

DOVER MACHINE WKS, Dover, Del.

HAND LEVER PUNCH.

Operated by Toggle Joint.

Powerful, easy-working, low price. The best yet made. Send for descriptive circulars and price to

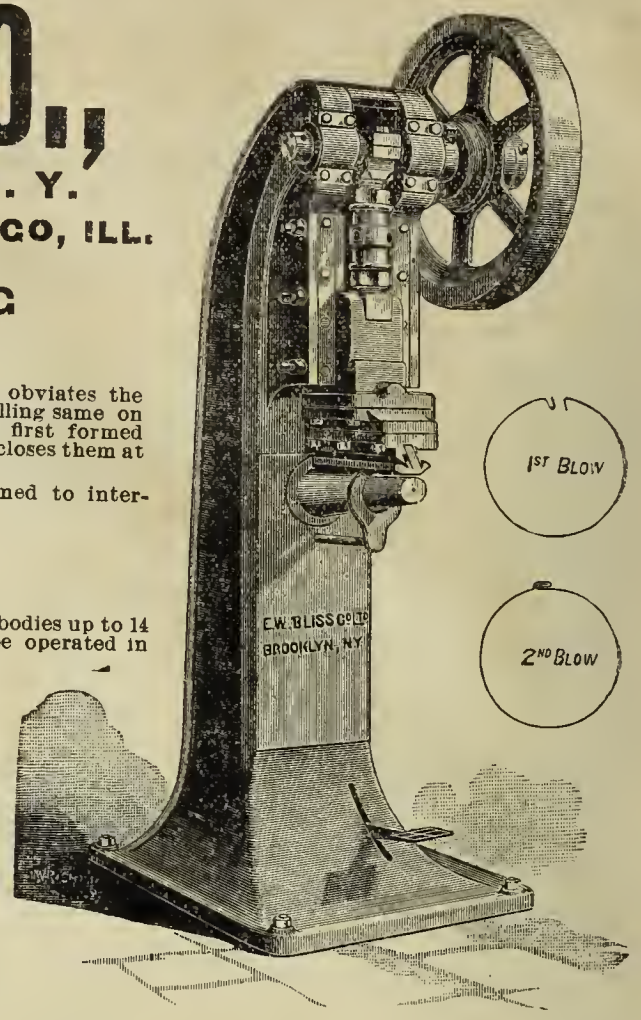
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



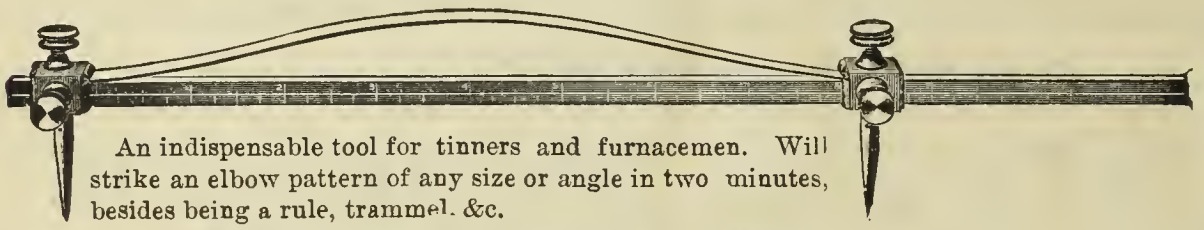
First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.



PRESSES, PUNCHES, SHEARS,

W. J. GORDON, PHILADELPHIA, PA

— A STREET CAR TRAGEDY.— They had mutual friends, and that fact emboldened him to speak without the ceremony of an introduction.

"Sloppy, isn't it?" he remarked persuasively.

"Rather," she replied.

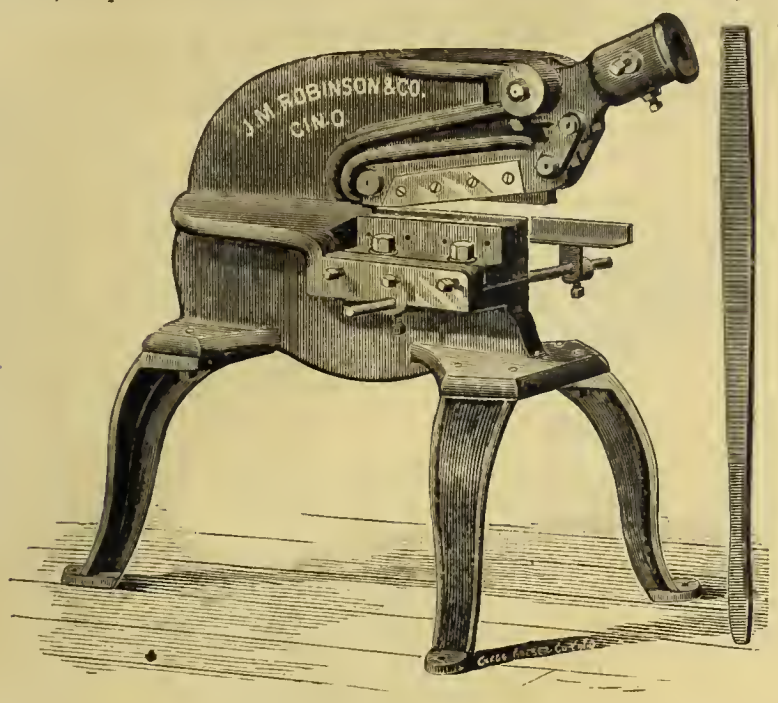
A freezing silence followed, but he had no intention of letting the opportunity slip.

"You wear a vewy lorg hatpin, do you know?" he said. "Weally, the end reaches out quite far."

"Yes, it's quite a protection."

"But it's all rusty."

"That isn't rust."



"No? How vewy queer!"

"It is the blood of chappies who have spoken to me in the street car without an introduction."

"That fellow must have forgotten something," said the conductor as the chappie bounced from the car without asking him to stop.

A Good Mechanic with Poor Tools

is very much like a poor mechanic with good tools—neither produce the best results. Every business, however, requires the best that can be obtained in the way of tools and machinery. For sheet metal working of any kind we are producing a line of machinery that for general excellence is unsurpassed. When in need of any machinery for the purpose, we would be glad to show you what we have. It won't cost you anything to investigate. Our place of business is at the S. E. cor. of Second St. and Central Avenue, Cincinnati, Ohio.

BARSTOW STOVE COMPANY,

INCORPORATED,

BOSTON. PROVIDENCE, R. I. NEW YORK.

Look Out For Acid Flux

IN THE SEAMS OF CONTINUOUS ROOFING TIN.

★

We have found it in all that we have tested of **makes other than our own.**

Acid is the **greatest enemy** of Roofing Tin, because it eats through the iron.

There is a very simple but reliable plan for detecting the presence of acid which we will furnish upon application.

The seams in *Our* CONTINUOUS ROOFING TIN are absolutely free from acid, **because there is none used.**

TRADE  MARK.

MANUFACTURERS OF

PATENT PLANISHED SHEET IRON,

PATENTED:

December 10th, 1878.	March 4th, 1884.	August 31st, 1886.
January 10th, 1882.	April 15th, 1884.	January 1st, 1889.
January 1st, 1884.	June 10th, 1884.	January 17th, 1893.
February 12th, 1884.	January 6th, 1885.	

Guaranteed fully equal, in all respects, to the IMPORTED RUSSIA IRON. Also WOOD'S SMOOTH FINISHED SHEET IRONS and SHEET STEEL of different qualities CLEANED AND FREE FROM DUST.

General Offices and Works, McKEESPORT, PA.
Branch Office, 111 Water St., Pittsburgh, Pa.

HAMILTON'S
BEST REDIPPED AMERICAN ROOFING TIN

IS DIPPED AND REDIPPED by HAND, and is NOT coated by machines through ROLLS like some plates that are lauded so highly by the makers, and the coating on Hamilton's Best Redipped is as heavy on the TOP half of the sheet as it is on the BOTTOM half. You have scales, test it. We can furnish machine coated plates with 20 lbs. of coating to the box of I. C. 20 x 28 at $11.50 per box, fully equal to any of the so-called extra coated plates.

JOHN HAMILTON,

PITTSBURGH, PA.

McCLURE'S REDIPPED
ROOFING TIN.

AMERICAN MADE.

The **durability** of a Roofing Plate is in the amount and quality of Coating and not in the iron.

McCLURE'S REDIPPED

Is the finest and heaviest coated Roofing Plate made; guaranteed to contain **35 lbs. Coating** per 112 sheets.

To reduce the price of a Roofing Plate is simply to reduce the quality and amount of coating, thereby making a much inferior plate.

The high quality of **McClure's Redipped** will always be maintained as it is our desire to make the **finest and heaviest coated** Roofing Plate in the market regardless of any cost.

The best is always the cheapest.

McCLURE & CO., Pittsburgh, Pa.
